Introduction

The impact of medical conditions on driving

Driving involves a complex and rapidly repeating cycle that requires a level of skill and the ability to interact simultaneously with both the vehicle and the external environment. Information about the environment is via the visual and auditory senses and is acted on by many cognitive processes (including short- and long-term memory, and judgement) to effect decisions for the driving task in hand. These decisions are enacted by the musculoskeletal system, which acts on the controls of the vehicle and its relation to the road and other users.

The whole process is coordinated by complex interactions involving behaviour, strategic and tactical abilities, and personality. In the face of illness or disability, adaptive strategies are important for maintaining safe driving.

Safe driving requires, among other elements, the involvement of:

- vision
- visuospatial perception
- hearing
- attention and concentration
- memory
- insight and understanding
- judgement
- adaptive strategies
- good reaction time
- planning and organisation
- ability to self-monitor
- sensation
- muscle power and control
- coordination.

Given these requirements, it follows that many body systems need to be functional for safe driving – and injury or disease may affect any one or more of these abilities. Notwithstanding this, many short term conditions do not require notification to the DVLA.

The guidelines and their development

The drivers’ medical section within the DVLA deals with all aspects of driver licensing when there are medical conditions that impact, or potentially impact, on safe control of a vehicle.

To do this, the DVLA develops and works within guidance, and this publication summarises the national medical guidelines on fitness to drive. It is intended to assist doctors and other healthcare professionals in advising their patients:

- whether or not the DVLA requires notification of a medical condition
- what the licensing outcome from the DVLA’s medical enquiries is likely to be.
Introduction

Some of the guidelines – for example, those around diabetes mellitus, epilepsy and vision – are set against legislative requirements (see Appendix A, page 102 for details) but others are the result of advice from the six Honorary Medical Advisory Panels to the Secretary of State, which cover:

- cardiology
- neurology
- diabetes
- vision
- alcohol or substance misuse and dependence
- psychiatry.

Each panel consists of acknowledged experts in the relevant area and includes DVLA and lay membership. The panels meet biannually and, between meetings, give continual advice to the Secretary of State and the DVLA.

The medical standards are continually reviewed and updated when indicated in light of recent developments in medicine generally, and traffic medicine in particular. The most up-to-date version of this guide will always be online on GOV.UK.

UK driver licensing

Licensing and licence groups

The UK medical standards for driver licensing refer to Group 1 and Group 2 licence holders:

- Group 1 includes cars and motorcycles
- Group 2 includes large lorries (category C) and buses (category D).

In most cases, the medical standards for Group 2 drivers are substantially higher than for Group 1 drivers. This is because of the size and weight of the vehicle and the length of time an occupational driver typically spends at the wheel.

Drivers who were awarded a Group 1 category B (motor car) licence before 1st January 1997 have additional entitlement to categories C1 (medium-sized lorries, 3.5t to 7.5t) and D1 (minibuses, 9 to 16 seats, not for hire or reward). Drivers with this entitlement retain it only until their licence expires or it is revoked for medical reasons.

Under certain circumstances, volunteer drivers may drive a minibus of up to 16 seats without category D1 entitlement. The DVLA outlines the rules for such circumstances on the GOV.UK website (see Driving a minibus).

Age limits for licensing

Group 1

Licences are normally valid until 70 years of age (the 'til 70 licence) unless restricted to a shorter duration for medical reasons.

There is no upper age limit to licensing, but after 70 renewal is required every 3 years.

A person in receipt of the mobility component of Personal Independence Payment can hold a driving licence from 16 years of age. (A person can’t apply for PIP until their 16th birthday.)

Group 2

Group 2 entitlement to drive lorries (category C) or buses (category D) is normally given to people over 21 and is valid until the age of 45. Group 2 licences issued since 19th January 2013 are valid for a maximum of five years. Group 2 licences must be renewed every 5 years or at age 45 whichever is the earlier until the age of 65 when they are renewed annually without an upper age limit. Shorter licences may be issued for medical reasons.

There are exceptions, such as driving in the armed forces, and people of a minimum age of 18 can drive lorries and buses after gaining, or training towards, the Driver Certificate of Professional Competence (CPC).

All initial Group 2 licence applications require a medical assessment by a registered medical practitioner (recorded on the D4 form). The same assessment is required again at 45 years of age and on any subsequent reapplication.
General information

Police, fire, ambulance and health service driver licensing
The same medical standards apply for drivers of police, fire, coastguard, ambulance and health service vehicles as they do for all drivers holding Group 1 and 2 licences. Any responsibility for determining higher medical standards, over and above these licensing requirements, rests with the individual force, service or other relevant body.

Note, however, that the Secretary of State’s Honorary Medical Advisory Panel on Diabetes and Driving has recommended that drivers with insulin-treated diabetes do not drive emergency vehicles. This takes account of the difficulties for an individual, regardless of whether they may appear to have exemplary glycaemic control, in adhering to the monitoring processes required when driving in response to an emergency.

Taxi licensing
Responsibility for determining any higher standards and medical requirements for taxi drivers, over and above the driver licensing requirements, rests with Transport for London in the Metropolitan area, or the Local Authority in all other areas.

This guide for local authorities recommends that taxi drivers should meet the same medical standards that Group 2 bus and lorry drivers must meet under the DVLA’s requirements.

Interpretation of EU and UK legislation
The advice of the Honorary Medical Advisory Panels on the interpretation of EU and UK legislation and its appropriate application is made within the context of driver licensing.

Sudden disabling events
Anyone with a medical condition likely to cause a sudden disabling event at the wheel, or who is unable to control their vehicle safely for any other reason, must not drive.

The DVLA defines the risk of a sudden disabling event as:
- 20% likelihood of an event in 1 year for Group 1 licensing
- 2% likelihood of an event in 1 year Group 2 licensing.

These figures, while originally defined by older studies, have since been revalidated by more recent risk-of-harm calculations.
General information

DVLA notification by drivers or healthcare professionals

Applicants and licence holders have a legal duty to:

- notify the DVLA of any injury or illness that would have a likely impact on safe driving ability (except some short-term conditions, as set out in this guide)
- respond fully and accurately to any requests for information from either the DVLA or healthcare professionals
- comply with the requirements of the issued licence, including any periodic medical reviews indicated by the DVLA.

They should also adhere, with ongoing consideration of fitness to drive, to prescribed medical treatment, and to monitor and manage the condition and any adaptations.

Doctors and other healthcare professionals should:

- advise the individual on the impact of their medical condition for safe driving ability
- advise the individual on their legal requirement to notify the DVLA of any relevant condition
- treat, manage and monitor the individual’s condition with ongoing consideration of their fitness to drive
- notify the DVLA when fitness to drive requires notification but an individual cannot or will not notify the DVLA themselves.

Of course, this last obligation on professionals may pose a challenge to issues of consent and the relationship between patient and healthcare professional. The GMC and The College of Optometrists offer guidance on this which is summarised below. (Note that the GMC is currently considering updating this guidance.)

In law it is the duty of the licence holder or applicant to notify the DVLA of any medical condition that may affect safe driving. This notification by people with licences issued by the DVLA (because they live in England, Scotland or Wales) may be done via GOV.UK – see Medical conditions, disabilities and driving.

For people with licences issued by the Driver and Vehicle Agency in Northern Ireland, the options for direct notification are given on the www.nidirect.gov.uk page on How to tell DVA about a medical condition.

Circumstances may arise in which a person cannot or will not notify the DVLA. It may be necessary for a doctor, optometrist or other healthcare professional to consider notifying the DVLA under such circumstances if there is concern for road safety, which would be for both the individual and the wider public.

The General Medical Council and The College of Optometrists offer clear guidance about notifying the DVLA when the person cannot or will not exercise their own legal duty to do so.

The GMC guidelines (reproduced with permission) state:

1. The driver is legally responsible for informing the DVLA about such a condition or treatment. However, if a patient has such a condition, you should explain to the patient:
   a) That the condition may affect their ability to drive (if the patient is incapable of understanding this advice, for example because of dementia, you should inform the DVLA immediately) and;
   b) That they have a legal duty to inform the DVLA about the condition.
General information

2. If a patient refuses to accept the diagnosis, or the effect of the condition on their ability to drive, you can suggest that they seek a second opinion, and help arrange for them to do so. You should advise the patient not to drive in the meantime.

3. If a patient continues to drive when they may not be fit to do so, you should make every reasonable effort to persuade them to stop. As long as the patient agrees, you may discuss your concerns with their relatives, friends or carers.

4. If you do not manage to persuade the patient to stop driving, or you discover that they are continuing to drive against your advice, you should contact the DVLA immediately and disclose any relevant medical information, in confidence, to the medical adviser.

5. Before contacting the DVLA, you should try to inform the patient of your decision to disclose personal information. You should also inform the patient in writing once you have done so.

See the full guidance at the GMC website, Confidentiality: reporting concerns about patients to the DVLA or the DVA.

The College of Optometrists offers similar guidance, available in full at its website under the confidentiality section of its Guidance for Professional Practice (use the subsection on ‘disclosing information about adults without their consent’).

This guidance includes the following (reproduced with permission of The College of Optometrists):

(C73) If you think the patient may be engaging in an activity where they pose a very real risk of danger to the public or themselves, such as the patient driving when they are not fit to drive, but you are not sure whether you should act, ask yourself:
1. what might the outcome be in the short or longer term if I do not raise my concern?
2. how could I justify why I did not raise the concern?

(C74) If you decide to proceed, you should:
1. first advise the patient that they are unfit to engage in the activity in question and give the reasons
2. advise the patient to tell the appropriate authority
3. put your advice in writing to the patient, if appropriate
4. keep a copy of any correspondence to the patient on the patient record.

Notification can be provided by healthcare professionals in the above circumstances, in confidence:

General information

How the DVLA responds to notification and applies the medical standards

Once the DVLA is notified of a medical condition and obtains consent, it will make medical enquiries as required.

The Secretary of State (in practice, the DVLA) is unable to make a licensing decision until all the relevant medical information is available and has been considered. Exceptions to this do exist, specifically the DVLA’s ability to revoke a licence immediately in the interests of road safety and without detailed enquiry if individual case circumstances dictate this.

The DVLA’s medical enquiries procedure is generally a two-stage process:

1. Information on the medical condition is sought from the licence holder or applicant, either by paper questionnaire or online
2. Information is sought from relevant healthcare professionals, either by questionnaire or provision of medical notes.

In some circumstances the DVLA will require independent review by a DVLA-appointed doctor or optician/optometrist. Depending on individual circumstances, a licence applicant may also require a driving assessment and/or appraisal.

Driving during medical enquiries

The time taken to obtain all necessary reports can be lengthy but a licence holder normally retains entitlement to drive under Section 88 of the Road Traffic Act 1988. However, a driver whose last licence was revoked or refused because of a medical condition or is a High Risk Offender re-applying after a drink/drive disqualification from 1 June 2013 would not, however, be eligible to drive until they are issued with a new licence.

The driver may be covered to drive but this carries implications for road safety in that the licence holder may continue to drive with a medical condition that, on completion of the DVLA’s enquiries, may ultimately result in licence withdrawal.

It is for the patient to assure themself that they are fit to drive. Medical professionals asked for an opinion about a patient’s fitness to drive in these circumstances should explain the likely outcome by reference to this guide. The final decision in relation to driver licensing will, however, rest with the DVLA.

By reference to the DVLA’s guidance, the doctor in charge of an individual’s care should be able to advise the driver whether or not it is safe for them to continue to drive during this period.

Patients must be reminded that if they choose to ignore medical advice to stop driving this may affect their insurance cover. Doctors are advised to formally and clearly document the advice given.

The DVLA is solely reliant on doctors and other healthcare professionals for the provision of medical information. To make timely licensing decisions that impact on the safety of the individual and the public, the DVLA needs information to be provided as quickly as possible.

When the DVLA holds all relevant information, a decision can then be made as to whether or not the driver or applicant satisfies the national medical guidelines and the requirements of the law. A licence is accordingly issued or refused/revoked.
General information

Outcome of medical enquiries
The DVLA does not routinely tell doctors of the outcome of a medical enquiry. Drivers are always informed of the outcome, either by being issued a licence or by notification of a refusal or revocation.

For cases in which the driver may not have the insight and/or memory function to abide by the refusal or revocation of their licence – for example, in cognitive impairment, dementia or a mental health condition – the DVLA would usually send a decision letter to the GP.

When a notification is received from a doctor in accordance with the GMC guidelines, unless relevant to one of these conditions affecting mental capacity, the DVLA will send an acknowledgement letter only to the GP, to confirm receipt of the original notification.

Medical notification form for use by healthcare professionals
The medical notification form for use when patients cannot or will not notify the DVLA themselves is available, for use by healthcare professionals only, on GOV.UK. This form is only for patients living in England, Scotland or Wales who hold a driving licence issued by the DVLA.

The completed form should be returned to:
medadviser@dvla.gsi.gov.uk
Medical Business Support
D7 West
DVLA
Swansea
SA6 7JL

For patients living in Northern Ireland who cannot or will not self-notify, please use these contact details:
dva@doeni.gov.uk
Telephone: 0300 200 7861
Drivers Medical Section
Driver and Vehicle Agency
Castlerock Road
Waterside
Coleraine
BT51 3TB

Please fill in all parts of the DVLA’s medical notification form in relation to the medical condition of your patient. Parts A and B are for your patient’s and your own details, including your signed and dated declaration that all details are correct to the best of your knowledge.

Part C of the form should be completed in all fields and providing as much detail as possible regarding your patient’s medical condition. You may send clinic letters with this notification, to help provide details of your patient’s medical condition or if you think it will aid the licensing decision.

Please note, your patient can request copies of any medical documents held at the DVLA unless you specify in writing that releasing this information could cause serious harm to your patient. The DVLA cannot be responsible for the payment of any fee associated with notification.
General information

Obtaining advice from the DVLA on fitness to drive

Contacting the DVLA's medical advisers

Doctors and other healthcare professionals are always welcome to write, fax, email or speak (by telephone between 10.30am and 1pm from Monday to Friday) to one of the DVLA's medical advisers.

Advice may be sought about a particular driver identified by a unique reference number, or about fitness to drive in general.

If the telephone service is busy, you will be able to leave a message for one of the medical advisers to call back.

The contact details for such enquiries in England, Scotland and Wales are:

- medadviser@dvla.gsi.gov.uk
- Telephone: 01792 782337
- Fax: 01792 761104
- The Medical Adviser
- Drivers Medical Group
- DVLA
- Swansea
- SA99 1DA

Please note that this service is for medical professionals only.

The contact details for enquiries in Northern Ireland are:

- Telephone: 0300 200 7861
- Drivers Medical Section
- Driver and Vehicle Agency
- Castlerock Road
- Waterside
- Coleraine
- BT51 3TB

Seat belt use and exemption

The law makes it compulsory for car occupants to wear seatbelts where fixed. Exemption on medical grounds requires a valid exemption certificate to confirm that, in a medical practitioner's view, exemption is justified. Exemption will require careful consideration in view of extensive evidence for the safety implications of seatbelts in reducing casualty rates.

The guidance leaflet 'Medical exemption from compulsory seat belt wearing' is on GOV.UK

Epilepsy

Epileptic seizures are the most common medical cause of collapse at the wheel. Appendix B, page 103 sets out the epilepsy regulations in current legislation.

The following definitions apply:
- epilepsy encompasses all events, including major, minor and auras
- if within a 24-hour period more than one epileptic event occurs, these are treated as a single event for the purpose of applying the epilepsy regulations.

The following features, in both Group 1 car and motorcycle and Group 2 bus and lorry drivers, are considered to indicate a good prognosis for a person under care for a first unprovoked or isolated epileptic seizure:
- no relevant structural abnormalities on brain imaging
- no definite epileptiform activity on EEG
- support of a neurologist
- annual risk of seizure considered to be 2% or lower for bus and lorry drivers.

<table>

</tr>
</thead>
<tbody>
<tr>
<td>Must not drive and must notify the DVLA.</td>
<td>Provided the licence holder or applicant satisfies the regulations, a review licence will usually be issued.</td>
<td>Must not drive and must notify the DVLA. The person with epilepsy must remain seizure-free for 10 years (without epilepsy medication) before licensing may be considered.</td>
</tr>
<tr>
<td>If there have been no seizures for 5 years (with medication if necessary), and no other disqualifying condition, a ‘til 70 licence is usually restored.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>First unprovoked epileptic seizure/isolated seizure</td>
<td>Must not drive and must notify the DVLA. Driving will be prohibited for 6 months from the date of the seizure. Clinical factors that indicate that there may be an increased risk of seizures require the DVLA not to consider licensing until after 12 months from the date of the first seizure.</td>
<td>Must not drive and must notify the DVLA. Driving will be prohibited for 5 years from the date of the seizure. If, after 5 years, a neurologist has made a recent assessment and clinical factors or investigation results (for example, EEG or brain scan) indicate no annual risk greater than 2% of a further seizure, the licence may be restored. Such licensing also requires that there has been no need for epilepsy medication throughout the 5 years up to the date of the licence being restored. If the prospective annual risk of further seizure is greater than 2%, the epilepsy regulations may apply.</td>
</tr>
</tbody>
</table>
### Chapter 01: Neurological disorders

<table>
<thead>
<tr>
<th>Secondary causes of seizure</th>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Must not drive and must notify the DVLA.</strong></td>
<td>In all cases of an epilepsy diagnosis, the epilepsy regulations apply to Group 1 car and motorcycle drivers. This includes all cases of single seizure in which a primary cerebral cause is present and the likelihood of recurrence cannot be excluded. When seizures have occurred at the time of an acute head injury or intracranial surgery these may be excepted from the epilepsy regulations. When seizures have occurred at the time of an intracranial venous thrombosis there must be 6 months without seizure before driving may resume.</td>
<td><strong>Must not drive and must notify the DVLA.</strong> In all cases in which a ‘liability to epileptic seizure’ – either primary or secondary – has been diagnosed, the specific epilepsy regulations apply for Group 2 bus and lorry drivers. The only possible exception is a seizure that occurred immediately at the time of an acute head injury or intracranial surgery, not some time after, and/or ‘no liability to seizure’ has been demonstrated. If there is an annual risk of seizure following head injury or intracranial surgery, it must have fallen to 2% or lower before the DVLA may license bus or lorry driving.</td>
</tr>
</tbody>
</table>

### Withdrawal of epilepsy medication

- See the special considerations below, and Appendix B, page 103 gives full guidance on withdrawing epilepsy medication (see page 106).

### Provoked seizures (except related to use of alcohol or illicit drugs)

- See the special considerations below.

### Dissociative seizures

- **Must not drive and must notify the DVLA.** Licensing may be considered once episodes have been satisfactorily controlled for 3 months and there are no relevant mental health issues. If there are high risk features, 6 months may be required with a specialist opinion.

### Seizure following an epilepsy-free period

- **Must not drive and must notify the DVLA.** The epilepsy regulations must apply.

### Two unprovoked seizures more than 5 years apart

- The epilepsy regulations will apply.

### Lesional epilepsy

- In cases of a seizure due to a structural lesion, the epilepsy regulations will apply.
Special considerations under the epilepsy regulations

Group 1 car and motorcycle

The following special considerations apply under the epilepsy regulations for drivers of cars and motorcycles:

1. The person with epilepsy may qualify for a driving licence if they have been free from any seizure for 1 year. This needs to include being free of minor seizures and epilepsy signs such as limb jerking, auras and absences. Episodes not involving a loss of consciousness are included.

2. The person who has had a seizure while asleep must stop driving for 1 year from the date of the seizure unless point 3 or 5 apply.

3. Relicensing may be granted if the person, over the course of at least 1 year from the date of the first sleep seizure, establishes a history or pattern of seizures occurring only ever while first asleep.

4. If a pattern of seizures is established for 1 year in which there is no influence on the level of consciousness and no influence on the ability to act, a continued licence may be allowed, provided the person also shows no history of any other type of unprovoked seizure.

5. If a pattern of 3 years of purely asleep seizures after a period of awake or awake and asleep can be demonstrated, a licence can be issued.

Overriding all of the above considerations is that the licence holder or applicant with epilepsy must not be regarded as a likely source of danger to the public while driving and that they are compliant with their treatment and follow up.

If the licensed driver has any epileptic seizure, they must stop driving immediately unless considerations 2, 3 or 4 can be met, and they must notify the DVLA.

If a licence is issued under consideration 3 or 4 and the driver has a different type of seizure, they lose the concession, must stop driving, and must notify the DVLA.

Isolated seizures

The person who has a first unprovoked epileptic seizure (isolated seizure) will usually qualify for a driving licence if they are free from any further seizure for 6 months. This is provided there are no other clinical factors or results of investigations that may increase the risk of a further seizure, in which case 12 months is required before driving may be relicensed.

Withdrawal of epilepsy medication (also see Appendix B, page 103)

If a seizure occurs as a result of a physician-directed reduction or change in epilepsy medication, the epilepsy regulations state that a licence must be revoked for 12 months. Relicensing may be considered earlier than this if treatment has been reinstated for 6 months, provided there was no further seizure in the 6 months after restarting the prescription.
Chapter 01: Neurological disorders

Group 2 bus and lorry
Drivers of buses and lorries must satisfy all of the following conditions under the epilepsy regulations. They must:

- hold a full ordinary driving licence
- have been free of epileptic seizures for the last 10 years
- not have taken any epilepsy medication during these 10 years (there are thus no special considerations for withdrawal)
- have no continuing liability to epileptic seizures
- not be a source of danger whilst driving.

Isolated seizure
Drivers of buses and lorries must satisfy all of the following conditions in relation to an isolated seizure. They must:

- hold a full ordinary driving licence
- have been free of epileptic attacks for the last 5 years
- not have taken any epilepsy medication during these 5 years
- have undergone a recent assessment by a neurologist
- have received satisfactory results from investigations.

Transient loss of consciousness (‘blackouts’) – or lost/altered awareness
Transient loss of consciousness (TLoC) or ‘blackout’ is very common – it affects up to half the population in the UK at some point in their lives. An estimated 3% of A&E presentations and 1% of hospital admissions are due to TLoC.

Road traffic collisions resulting from blackouts are two or three times more common than those resulting from seizures.

Recurrent TLoC (more than one isolated event), not including syncope, is uncommon – but always requires detailed medical assessment.

There are several causes of transient loss of consciousness:

- Syncope: See pages 19-21 of this chapter
- Seizure/epilepsy: See pages 14-16 of this chapter
- Hypoglycaemia: See page 59 for Chapter 3 (diabetes mellitus)
- Drug/alcohol: See page 76 for Chapter 5 (drugs or alcohol misuse or dependance)
- Sleep disorders: See page 95, ‘excessive sleepiness’ in Chapter 8 (miscellaneous)
- Undetermined: See pages 19-21 of this chapter, ‘syncope’
- Medication: See page 101, ‘medication effects’ in Chapter 8 (miscellaneous)
In relation to TLoC, three features are of note to medical practitioners:
- provocation
- posture
- prodrome.

With concern for road safety, however, the two most important features are:
- prodrome – are there warning signs sufficient in both nature and duration?
- posture – do the episodes of TLoC occur while sitting?

A prodrome must allow time for a driver to find a safe place to stop before losing consciousness. A prodrome is reliable if the signs are clear, consistent across all events and provide sufficient duration to find a safe stop, or unreliable if these are absent.

**Licence holders or applicants should be informed that they must notify the DVLA when TLoC occurs while sitting.**

For syncope occurring while standing or sitting, the following factors indicate high risk:
- abnormal ECG
- clinical evidence of structural heart disease.

Further investigations such as 48-hour ambulatory ECG, echocardiography and exercise testing may be indicated after specialist opinion has been sought.

Driving may be allowed to resume after 3 months if the cause has been identified and treated. If no cause has been identified, the licence will be refused or revoked for 12 months.](image12) |
Transient loss of consciousness – recurring episodes

Recurrent episodes of TLoC are less common than isolated episodes but the relevance to increased risk in driving cannot be overemphasised.

Recurrent TLoC is most commonly due to recurrent syncope, occurring in around 20% to 30% of patients. Recurrence of syncope is usually within three years of the first episode, and in over 80% of these cases there has been at least one additional episode within two years of the first episode.

With concern for road safety the two most important features of temporary loss of consciousness are:

- prodrome – are there warning signs sufficient in both nature and duration?
- posture – do the episodes of TLoC occur while sitting?

A prodrome must allow time for a driver to find a safe place to stop before losing consciousness. A prodrome is reliable if the signs are clear, consistent across all events and provide sufficient duration to find a safe stop, or unreliable if these are absent.

Licence holders or applicants should be informed that they must notify the DVLA when transient loss of consciousness occurs while sitting.

<tr>
<td><strong>While sitting</strong></td>
<td>Must not drive for 4 weeks. Driving may resume after 4 weeks only if the cause has been identified and treated. Must notify the DVLA if the cause has not been identified and treated.</td>
</tr>
</tbody>
</table>
For syncope occurring while standing or sitting, the following factors indicate high risk:
- abnormal ECG
- clinical evidence of structural heart disease.

Further investigations such as 48-hour ambulatory ECG, echocardiography and exercise testing may be indicated after specialist opinion has been sought.

**Unexplained syncope, including syncope without reliable prodrome**

This diagnosis may apply only after appropriate neurological and/or cardiological opinion and investigations have detected no abnormality.

**While standing or sitting**
- Must not drive and must notify the DVLA.
  - If no cause has been identified, the licence will be refused or revoked for 12 months.
- Must not drive and must notify the DVLA.
  - If no cause has been identified, the licence will be refused or revoked for 10 years.

**Cardiovascular but excluding typical syncope**

**While standing or sitting**
- Must not drive and must notify the DVLA.
  - Driving may resume after 4 weeks only if the cause has been identified and treated.
  - If no cause has been identified, the licence will be refused or revoked for 6 months.
- Must not drive and must notify the DVLA.
  - Driving may resume after 3 months only if the cause has been identified and treated.
  - If no cause has been identified, the licence will be refused or revoked for 12 months.

**Cough syncope or presyncope**

- Must not drive and must notify the DVLA.
  - Must not drive for 6 months following a single episode and for 12 months following multiple episodes over 5 years.
  - Reapplication may be considered at any point if all of the following can be satisfied:
    - any underlying chronic respiratory condition is well controlled
    - smoking cessation
    - body mass index is below 30
    - gastro-oesophageal reflux is treated.

- Must not drive and must notify the DVLA.
  - Must not drive for 5 years from the date of the last episode.
  - Reapplication may be considered after 1 year if all the following can be satisfied:
    - any underlying chronic respiratory condition is well controlled
    - smoking cessation
    - body mass index is below 30
    - gastro-oesophageal reflux is treated
    - confirmation of these by a specialist doctor.
Primary/central hypersomnias
– including narcolepsy

For other causes of excessive sleepiness, see Chapter 8 (miscellaneous conditions).

<table>

</thead>
<tbody>
<tr>
<td>Must not drive and must notify the DVLA. A licence may be reissued only after between 3 and 6 months of satisfactory symptom control with appropriate treatment. If not requiring treatment, relicensing may be considered after satisfactory objective assessment of maintained wakefulness, such as the Osler test.</td>
<td>Must not drive and must notify the DVLA. Relicensing may be considered subject to satisfactory objective assessment, performed by a specialist, of maintained wakefulness, such as the Osler test.</td>
</tr>
</tbody>
</table>

Chronic neurological disorders
– including multiple sclerosis and motor neurone disease

Any chronic neurological disorder that may affect vehicle control because of impaired coordination and muscle strength.

For information on in-car driving assessments for those with a disability, see Appendix G (page 118).

<table>
<thead>
<tr>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Must notify the DVLA. May drive as long as safe vehicle control is maintained at all times. A licence valid for 1, 2, 3 or 5 years may be issued provided medical enquiries by the DVLA and an assessment confirm that driving performance is not impaired. The licence may specify a restriction to cars with certain controls.</td>
<td>Must notify the DVLA. May drive as long as safe vehicle control is maintained at all times. A licence will be refused or revoked if the condition is progressive or disabling. If driving is not impaired and the underlying condition is stable, licensing will be considered on an individual basis subject to satisfactory medical reports and annual review.</td>
</tr>
</tbody>
</table>
### Parkinson’s disease

<table>
<thead>
<tr>

</table>
| Must not drive on presentation and must notify the DVLA.  
When satisfactory control of symptoms has been achieved, relicensing may be considered for restoration of the ‘til 70 licence. | Must not drive on presentation and must notify the DVLA.  
If there are sudden and disabling symptoms, the licence will be refused or revoked.  
If an underlying diagnosis is likely to cause recurrence, the patient must be asymptomatic and completely controlled for 1 year from an episode before reapplying for their licence. |
Stroke and transient ischaemic attack (TIA) – including amaurosis fugax

For Group 2 bus and lorry drivers, the guidance is the same whether concerning stroke, or single or multiple transient ischaemic attack (TIA).

<table>
<thead>
<tr>
<th>Stroke</th>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Must not drive but may not need to notify the DVLA. Driving may resume after 1 month if there has been satisfactory clinical recovery. The DVLA does not need to be notified unless there is residual neurological deficit 1 month after the episode and, in particular: visual field defects, cognitive defects and impaired limb function. Minor limb weakness alone after a stroke will not require notification to the DVLA unless restriction to certain types of vehicle or adapted controls may be needed. With adaptations, severe physical impairment may not be an obstacle to driving. Seizures occurring at the time of a stroke or TIA, or in the ensuing 24 hours, may be treated as provoked for licensing purposes, provided there is no previous history of seizure or cerebral pathology.</td>
<td>Must not drive and must notify the DVLA. A licence will be refused or revoked for 1 year following a stroke or TIA. Relicensing after 1 year may be considered if: there is no debarring residual impairment likely to affect safe driving and there are no other significant risk factors. Licensing may be subject to a satisfactory medical report, including results of exercise ECG testing. If imaging evidence shows less than 50% carotid artery stenosis and there is no previous history of cardiovascular disease, a licence may be issued without the need for functional cardiac assessment. Patients with recurrent TIAs or strokes will be required to undergo functional cardiac testing.</td>
</tr>
</tbody>
</table>

| Single transient ischaemic attack | Must not drive for 1 month but need not notify the DVLA. |

| Multiple transient ischaemic attack | Must not drive and must notify the DVLA. Multiple TIAs over a short period will require no driving for 3 months. Driving may resume after 3 months if there have been no further TIAs. |
Carotid artery stenosis

|                   | Driving may resume following clinical recovery provided there are no complications from the procedure.
## Arteriovenous malformation (AVM)

With any of the procedures, if another is also undertaken (for example, a ventriculoperitoneal shunt or a craniotomy for a haematoma) the standards for that procedure also apply and may take precedence.

Neurological disorders

Driving may resume on recovery providing there are no complications. If these occur, the relevant licensing standards would apply. The underlying conditions leading to surgery will require consideration.

Relicensing may be considered after 6 to 12 months from treatment depending on individual features.

### Hydrocephalus

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- Must not drive and must notify the DVLA.
  If the hydrocephalus is uncomplicated, driving may continue under the ‘till 70 licence.

- Must not drive and must notify the DVLA.
  Driving will be allowed to continue if the hydrocephalus is uncomplicated and there are no associated neurological problems.

### Intraventricular shunt or extraventricular drain – insertion or revision of upper end of shunt or drain

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>

</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- Group 1 (car and motorcycle)
  - Must not drive and must notify the DVLA.
  - The prospective risk from the underlying condition must be considered.

- Group 2 (bus and lorry)
  - Must not drive and must notify the DVLA.
  - The prospective risk from the underlying condition must be considered.

## Implanted electrodes

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

### Deep brain stimulation for movement disorder or pain

- **Should not drive but need not notify the DVLA.**
  - May drive if there are no complications from surgery and the patient is seizure-free, provided there is no debarring residual impairment likely to affect safe driving.

- **Must not drive and must notify the DVLA.**
  - Fitness to drive may be assessed for relicensing if there are no complications from surgery and the patient is seizure-free with an underlying condition that is non-progressive, provided there is no debarring residual impairment likely to affect safe driving.

### Implanted motor cortex stimulator for pain relief

- **Must not drive and must notify the DVLA.**
  - Driving may be relicensed after 6 months if the aetiology of the pain is non-cerebral – trigeminal neuralgia, for example.
  - If the aetiology is cerebral – stroke, for example – it will be 12 months before driving may be relicensed, provided there is no debarring residual impairment likely to affect safe driving.

- **Must not drive and must notify the DVLA.**
  - The licence will be refused or revoked.

<tr>
<td></td>
<td>Driving may resume after satisfactory symptom control.</td>
</tr>
<tr>
<td></td>
<td>Need not notify the DVLA.</td>
</tr>
</tbody>
</table>

**Must not drive and must notify the DVLA when symptoms occur.**

A licence will be refused or revoked if symptoms continue (treated or untreated).

Driving may be relicensed (provided there is no other disqualifying condition) if:

■ no angina for at least 6 weeks, and

■ the requirements for exercise or other functional tests can be met (see Appendix C, page 108).

Acute coronary syndromes (ACS)

**Acute coronary syndromes are defined as follows:**

■ unstable angina (symptoms at rest, with ECG changes)

■ non-ST elevation MI with at least two of the following three
  1. symptoms at rest
  2. raised serum troponin
  3. ECG changes

■ STEMI symptoms, with ST elevation on ECG.

<table>
<thead>
<tr>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Must not drive but need not notify the DVLA.</strong></td>
<td></td>
</tr>
</tbody>
</table>
| Driving may resume 1 week after successful coronary angioplasty and if:
  ■ no other urgent revascularisation planned (urgent means within 4 weeks of acute event)
  ■ LV ejection fraction is at least 40% before hospital discharge
  ■ there is no other disqualifying condition. |

**Must not drive and must notify the DVLA – for all ACSs.**

Licence will be refused or revoked.

Driving may be relicensed after at least 6 weeks and if:

■ the requirements for exercise or other functional tests can be met (see Appendix C, page 108)

■ there is no other disqualifying condition.

Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
Chapter 02: Cardiovascular disorders

If no successful coronary angioplasty, driving may resume only after 4 weeks from acute event, provided there is no other disqualifying condition.

Percutaneous coronary intervention (PCI) – elective angioplasty with or without stent

<table>
<thead>
<tr>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
</table>
| Must not drive but need not notify the DVLA. Driving may resume after at least 1 week provided there is no other disqualifying condition. | Must not drive and must notify the DVLA. Licence will be refused or revoked. Driving may be relicensed after at least 6 weeks and if:  
  - the requirements for exercise or other functional tests can be met (see Appendix C, page 108)  
  - there is no other disqualifying condition. |

Coronary artery bypass graft (CABG)

<table>
<thead>
<tr>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
</table>
| Must not drive but need not notify the DVLA. Driving may resume after at least 4 weeks provided there is no other disqualifying condition. | Must not drive and must notify the DVLA. Licence will be refused or revoked. Driving may be relicensed after at least 3 months and if:  
  - no evidence of significant left ventricular impairment – LV ejection fraction is at least 40%  
  - the requirements for exercise or other functional tests can be met (see Appendix C, page 108), also at least 3 months postoperatively  
  - there is no other disqualifying condition. |

Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
Arrhythmias

**Arrhythmias include:**
- sinoatrial disease
- significant atrioventricular conduction defect
- atrial flutter/fibrillation
- narrow or broad complex tachycardia.

**Note:**
- if a transient arrhythmia occurs during an acute coronary syndrome, the guidance relating to ACS takes precedence (page 43)
- pacemakers are considered separately (page 46).

<table>
<thead>

- May drive provided there is no other disqualifying condition. Must notify the DVLA.  
- May drive provided there is no other disqualifying condition. Must notify the DVLA. *Note:* also refer to the implantable cardioverter defibrillator (ICD) requirements below.  
- Must not drive and must notify the DVLA. Licence will be refused or revoked permanently.

*Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%*
Implantable cardioverter defibrillator (ICD)

**Group 1 car and motorcycle**

In all cases of ICD for sustained ventricular arrhythmia associated with incapacity, **driving must stop** for 6 months from the date of ICD implantation and any resumption requires:
- the device being under regular review with interrogation
- no other disqualifying condition.

**Group 2 bus and lorry**

ICD implantation is a permanent bar to Group 2 licensing. In all cases of ICD implantation (including prophylactic ICD implantation) driving must stop permanently and:
- the DVLA must be notified
- the licence will be refused or revoked permanently.

<table>

<td></td>
</tr>
<tr>
<td>- Must not drive and may need to notify the DVLA. Must not drive for 2 years after symptoms of incapacity and must notify the DVLA. Exceptions to this 2 year requirement apply as follows, but the minimum initial restriction after implantation still applies (i.e. must not drive for 6 months).</td>
<td>Must not drive and must notify the DVLA. Licence will be refused or revoked permanently.</td>
</tr>
</tbody>
</table>

---

*Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%*
Chapter 02: Cardiovascular disorders

1. If therapy delivery was due to an inappropriate cause such as atrial fibrillation or, for example, programming issues:
   - driving may resume 1 month after complete control of any cause to the satisfaction of the cardiologist.

2. If therapy delivery was due to sustained ventricular tachycardia or ventricular fibrillation:
   - driving may resume 6 months after event
   - provided preventive steps against recurrence have been taken with anti-arrhythmic drugs or ablation procedure, for example
   - and provided there is an absence of further symptomatic therapy.

3. With any revision of electrodes or alteration of anti-arrhythmic drug treatment
   - Must not drive but need not notify the DVLA.
   - Driving may resume 1 month after electrode revision or drug alteration.
   - The minimum initial restriction after implantation still applies (must not drive for 6 months).

4. With defibrillator box change
   - Must not drive but need not notify the DVLA.
   - Driving may resume 1 week after box change.
   - The minimum initial restriction after implantation still applies (must not drive for 6 months).

ICD for sustained ventricular arrhythmia not associated with incapacity

- Must not drive for 1 month and may need to notify the DVLA.
  - Driving may resume 1 month after implantation and the DVLA need not be notified, provided:
    - presentation was a ‘non-disqualifying’ cardiac event – i.e. haemodynamically stable sustained ventricular tachycardia without incapacity
    - LV ejection fraction is greater than 35%
    - no fast ventricular tachycardia (VT) induced on electrophysiological study – i.e. RR interval of less than 250 milliseconds

- Must not drive and must notify the DVLA.
  - Licence will be refused or revoked permanently.

Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
during the postimplantation study, any induced VT could be pace-terminated by the ICD twice, without acceleration.

Note: should ICD subsequently deliver anti-tachycardia pacing and/or shock therapy (except during normal clinical testing), the DVLA must be notified and the restrictions must be applied as for sustained ventricular arrhythmia associated with incapacity (see page 47).

Prophylactic ICD

In asymptomatic individuals with a high risk of significant arrhythmia

- Must not drive and must notify the DVLA.
- driving may resume 1 month after implantation (need not notify the DVLA if remains asymptomatic and no ICD therapy needed)
- should the ICD subsequently deliver anti-tachycardia pacing and/or shock therapy (except during normal clinical testing), the DVLA must be notified and the restrictions must be noted as for sustained ventricular arrhythmia associated with incapacity (see page 47)
- need not notify the DVLA if remains asymptomatic and no ICD therapy needed.

- Must not drive and must notify the DVLA. Licence will be refused or revoked permanently.

Aortic aneurysm
- ascending or descending thoracic and/or abdominal

<td>Managed risk</td>
<td>▲ May drive but must notify the DVLA if aneurysm diameter is between 6 cm and 6.4 cm. Driving may be relicensed subject to annual review.</td>
<td>▲ Must not drive and must notify the DVLA if the aneurysm diameter is 5.5 cm or greater. Licence will be refused or revoked. Driving may be relicensed after successful surgical treatment without evidence of further enlargement and no other disqualifying condition.</td>
</tr>
</tbody>
</table>

Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
Chapter 02: Cardiovascular disorders

High risk

- Must not drive and must notify the DVLA if aneurysm diameter is **6.5 cm or greater**.
  Licence will be refused or revoked.
  Driving may be relicensed after successful surgical treatment without evidence of further enlargement and no other disqualifying condition.

- Must not drive and must notify the DVLA if the aneurysm diameter is **5.5 cm or greater**.
  Licence will be refused or revoked.
  Driving may be relicensed after successful surgical treatment without evidence of further enlargement and no other disqualifying condition.
  For surgically treated abdominal aortic aneurysm the exercise or other functional test requirements will need to be met.

Aortic dissection

**Note:** ‘well controlled’ blood pressure means clinically relevant to aortic dissection, not the DVLA standard for hypertension.

<table>
<thead>
<tr>

<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>car and motorcycle</strong></td>
<td><strong>bus and lorry</strong></td>
</tr>
</tbody>
</table>

- Must not drive and may need to notify the DVLA.
  If aortic diameter exceeds 6 cm driving may resume after satisfactory surgical intervention and/or:
  - satisfactory medical therapy (blood pressure well controlled)
  - medical follow-up
  - no other disqualifying condition.
  If aortic diameter is 6 cm or greater, the driving restrictions given under aortic aneurysm (see above) must take effect, with the DVLA notified.

- Must not drive and must notify the DVLA.
  Licence will be refused or revoked.
  Driving may be relicensed only after all the following are met:
  - if chronic aortic dissection maximum transverse diameter of the aorta is less than 5.5 cm (including the false lumen)
  - complete thrombosis of the false lumen
  - medical follow up in place
  - satisfactory surgical intervention and/or
  - satisfactory medical therapy (blood pressure well controlled).

*Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%*
## Marfan syndrome and other inherited aortopathies

<table>
<thead>
<tr>

<tr>
<th></th>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
</table>
| ▶️ May drive and need not notify the DVLA. There must be no other disqualifying condition. | ▶️ May drive but must notify the DVLA. Driving may be relicensed only if:  
- there is no symptomatic myocardial ischemia, and  
- the exercise or other functional test requirements can be met (see Appendix C, page 108). |

*Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%*
Hypertension

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- ▲ May drive and need not notify the DVLA, except:
  - ● Must not drive if treatment for any level of hypertension causes side-effects that affect or are likely to affect safe driving (but need not notify the DVLA).

- ▲ May drive and need not notify the DVLA, except:
  - ● Must not drive and must notify the DVLA if resting BP is consistently:
    - 180 mm Hg or higher systolic and/or
    - 100 mm Hg or more diastolic.

  Driving may be relicensed after BP is controlled, provided there are no side-effects from treatment that affect or are likely to affect safe driving.

Cardiomyopathies

Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%.

Also refer to the following sections in this document:

- arrhythmias (page 45)
- pacemaker implant (page 46)
- implantable cardioverter defibrillator (page 47).

Hypertrophic cardiomyopathy (HCM)

Asymptomatic

- ▲ May drive and need not notify the DVLA.

There must be no other disqualifying condition.

- ● Must not drive and must notify the DVLA.

Driving may be relicensed only after at least a 25 mm Hg increase in systolic blood pressure during exercise testing (testing to be repeated every 3 years) has been demonstrated and at least two of the following three criteria are met:

1. no first-degree family history of sudden premature death from presumed HCM

Note: the DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
Chapter 02: Cardiovascular disorders

### Note:
The DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%.

**Cardiovascular disorders**

2. HCM not anatomically severe – wall thickness no greater than 3 cm confirmed by cardiologist
3. no serious abnormality of heart rhythm such as non-sustained ventricular tachycardia (NSVT).

See Appendix C, page 108 for full details.

Diabetes mellitus

Information sent to drivers

Insulin-treated drivers are sent a detailed letter from the DVLA explaining the licensing requirements and driving responsibilities.

All drivers with diabetes must follow the information provided in ‘Information for drivers with diabetes’, which includes a notice of when they must contact the DVLA (see Appendix D, page 111).

Insulin-treated diabetes

Impaired awareness of hypoglycaemia

The Secretary of State’s Honorary Medical Advisory Panel on Driving and Diabetes has defined impaired awareness of hypoglycaemia for Group 1 drivers as ‘an inability to detect the onset of hypoglycaemia because of total absence of warning symptoms’. Group 2 drivers must have full awareness of hypoglycaemia.

Severe hypoglycaemia

‘Severe’ is defined as hypoglycaemia requiring another person’s assistance.

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

⚠ Must meet the criteria to drive and must notify the DVLA.

All the following criteria must be met for the DVLA to license the person with insulin-treated diabetes for 1, 2 or 3 years:

- adequate awareness of hypoglycaemia
- no more than 1 episode of severe hypoglycaemia in the preceding 12 months
- practises appropriate blood glucose monitoring as defined in the box below
- not regarded as a likely risk to the public while driving
- meets the visual standards for acuity and visual field (see Chapter 6, visual disorders, page 83).

⚠ Must meet the criteria to drive and must notify the DVLA.

All the following criteria must be met for the DVLA to license the person with insulin-treated diabetes for 1 year (with annual review as indicated last below):

- full awareness of hypoglycaemia
- no episode of severe hypoglycaemia in the preceding 12 months
- practises blood glucose monitoring with the regularity defined in the box below
- must use a glucose meter with sufficient memory to store 3 months of readings as detailed below
- demonstrates an understanding of the risks of hypoglycaemia
- no disqualifying complications of diabetes (see page 65) that would mean a licence being refused or revoked, such as visual field defect (see Chapter 6, visual disorders, page 83).
Group 1 recommendations and Group 2 requirements for insulin-treated drivers licensed on review

The Secretary of State’s Honorary Medical Advisory Panel on Driving and Diabetes has defined the self-monitoring requirements for licensing as follows.

Group 1 car and motorcycle
- blood glucose testing no more than 2 hours before the start of the first journey and
- every 2 hours while driving
- applicants will be asked to sign an undertaking to comply with the directions of the healthcare professionals treating their diabetes and to report any significant change in their condition to the DVLA immediately.

More frequent self-monitoring may be required with any greater risk of hypoglycaemia (physical activity, altered meal routine).

Group 2 bus and lorry
- regular blood glucose testing – at least twice daily including on days when not driving and
- no more than 2 hours before the start of the first journey and
- every 2 hours while driving.

More frequent self-monitoring may be required with any greater risk of hypoglycaemia (physical activity, altered meal routine), in which case a bus or lorry driver may be licensed if they:
- use one or more glucose meters with memory functions to ensure 3 months of readings that will be available for assessment.

How the DVLA checks diabetes management requirements for insulin-treated Group 2 bus and lorry licensing

The DVLA takes the following measures to ensure the requirements are met for licensing of insulin-treated Group 2 bus and lorry drivers:
- requires the applicant’s usual doctor who provides diabetes care to undertake an annual examination including review of the previous 3 months of glucose meter readings
- arranges an examination to be undertaken every 12 months by an independent consultant specialist in diabetes if the examination by their usual doctor is satisfactory
- at the examination, the consultant will require sight of blood glucose self-monitoring records for the previous 3 months stored on the memory of a blood glucose meter
- the license application process cannot start until an applicant’s condition has been stable for at least 1 month
- applicants will be asked to sign an undertaking to comply with the directions of the healthcare professionals treating their diabetes and to report any significant change in their condition to the DVLA immediately.

Continuous glucose monitoring systems (CGMS)
Because these systems measure interstitial glucose, drivers must also monitor blood glucose levels as outlined immediately above.
### Impaired awareness of hypoglycaemia – ‘hypoglycaemia unawareness’

<table>

</tbody>
</table>

Managed by tablets carrying hypoglycaemia risk

**Including sulphonylureas and glinides**

⚠️ May drive and need not notify the DVLA, provided:
- no more than 1 episode of severe hypoglycaemia in the last 12 months
- if needed, detection of hypoglycaemia is by appropriate blood glucose monitoring at times relevant to driving and clinical factors, including frequency of driving
- under regular review.

It may be appropriate to monitor blood glucose depending on a number of factors including frequency and/or duration of driving, in which case monitoring should be carried out at times relevant to driving.

If the above requirements and those set out in Appendix D (page 111) are met, the DVLA need not be informed.

The DVLA must be notified if clinical information indicates the agency may need to undertake medical enquiries.

**Excluding sulphonylureas and glinides**

⚠️ May drive and need not notify the DVLA, provided the requirements set out in Appendix D (page 111) are met and the driver is under regular medical review.

⚠️ May drive but must notify the DVLA if clinical information indicates the agency may need to undertake medical enquiries.

⚠️ May drive but must notify the DVLA.

All the following criteria must be met for the DVLA to issue a licence for 1, 2 or 3 years:
- no episode of severe hypoglycaemia in the last 12 months
- full awareness of hypoglycaemia
- regular self-monitoring of blood glucose – at least twice daily and at times relevant to driving
- demonstrates an understanding of the risks of hypoglycaemia
- has no disqualifying complications of diabetes that mean a licence will be refused or revoked, such as visual field defect.

The DVLA may issue a licence if the requirements set out in Appendix D (page 111) are met and the driver is under regular medical review.

A licence is refused or revoked if relevant disqualifying complications have developed, such as diabetic retinopathy affecting visual acuity or visual fields.

A short-term licence may be issued if diabetes complications have developed but the required medical standards have been met.
## Diabetes managed by diet/lifestyle alone

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- May drive and need not notify the DVLA.
- Must not drive and must notify the DVLA if, for example:
  - relevant disqualifying complications develop such as diabetic retinopathy affecting visual acuity or visual fields
  - insulin treatment is required (see the requirements for insulin-treated diabetes on page 60).

## Hypoglycaemia due to other causes

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- If there are episodes of severe hypoglycaemia from any cause other than diabetes treatment driving must stop while the liability to episodes remains.
Examples include hypoglycaemia post-bariatric surgery or in association with eating disorders, and the restriction applies for both car and motorcycle, and bus and lorry drivers.
- Licensing is on the provision that the patient has no disqualifying condition.
- If the patient is on insulin, refer to page 60 for the section on insulin-treated diabetes.

## Pancreas transplant

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- May drive but must notify the DVLA.
Licensing is on the provision that the patient has no disqualifying condition.
If the patient is on insulin, refer to page 60 for the section on insulin-treated diabetes.
- May drive but must notify the DVLA.
Licensing will require individual assessment.
If the patient is on insulin, refer to page 60 for the section on insulin-treated diabetes.
## Islet cell transplantation

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

⚠️ May drive but must notify the DVLA. Licensing is on the provision that the patient has no disqualifying condition, and is issued for a term requiring medical review. If the patient is on insulin, refer to page 60 for the section on insulin-treated diabetes.

⚠️ May drive but must notify the DVLA. Licensing will require individual assessment. If the patient is on insulin, refer to page 60 for the section on insulin-treated diabetes.

<td>May drive and need not notify the DVLA. See Appendix E, page 115 for medication considerations relevant to driving.</td>
<td>Must not drive and must notify the DVLA. Licensing will depend on the outcome of medical enquiries, and the DVLA will require a period of stability. Particular danger would be posed by those who may attempt suicide at the wheel.</td>
<td>Must not drive and must notify the DVLA. Licensing will depend on the outcome of medical enquiries, and the DVLA will require a period of stability. Particular danger would be posed by those who may attempt suicide at the wheel.</td>
</tr>
</tbody>
</table>

Persistent alcohol and/or drug misuse or dependence

- See Chapter 5, page 76.
- If psychiatric illness has been associated with substance misuse, continued misuse contraindicates driving and licensing.

Severe anxiety or depression

Note: effects of severe illness are of greater importance for their relevance to driving than medication – but see Appendix E, page 115 for additional considerations, on medication.

<table>

## Acute psychotic disorder

### Persistent alcohol and/or drug misuse or dependence

- See Chapter 5, page 76.
- If psychiatric illness has been associated with substance misuse, continued misuse contraindicates driving and licensing.

### Group 1

**car and motorcycle**

- Must not drive during acute illness and must notify the DVLA. Licensing may be considered if all of these conditions are met:
  - remained well and stable for at least 3 months
  - adheres to any agreed treatment plan
  - regained insight
  - free from any medication effects that would impair driving
  - subject to a suitable specialist report being favourable.

Drivers with a history of instability and/or poor engagement with treatment will be required not to drive for a longer period before any relicensing.

### Group 2

**bus and lorry**

- Must not drive during acute illness and must notify the DVLA. Licensing may be considered if all of these conditions are met:
  - remained well and stable for at least 12 months
  - adheres to any agreed treatment plan
  - regained insight
  - free from any medication effects that would impair driving
  - subject of a favourable report from a specialist in psychiatry.

The minimum effective antipsychotic dosage should be sought, in line with good practice. Drug tolerability should be optimal and not associated with any deficits that might impair driving, such as to alertness, concentration or motor performance.

Established illness with a history suggesting a likelihood of relapse: the risk of this needs to be considered low.

The DVLA will normally require the report of a specialist in psychiatry that specifically addresses the above issues as relevant to driving before it may grant a licence.
### Hypomania or mania

#### Persistent alcohol and/or drug misuse or dependence
- See Chapter 5, page 76.
- If psychiatric illness has been associated with substance misuse, continued misuse contraindicates driving and licensing.

#### For Group 2 bus and lorry driving, in both stable and unstable conditions:
- the minimum effective dosage of any antipsychotic medication should be sought, in line with good practice. Drug tolerability should be optimal and not associated with any deficits that might impair driving, such as to alertness, concentration or motor performance
- established illness with a history to suggest a likelihood of relapse: the risk of this must be considered low.

<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

⚠️ May be able to drive but must notify the DVLA.

It is difficult to assess driving ability in people with dementia. The DVLA acknowledges that there are varied presentations and rates of progression, and the decision on licensing is usually based on medical reports.

Considerations include:

- poor short-term memory, disorientation, and lack of insight and judgement almost certainly mean no fitness to drive
- disorders of attention cause impairment
- in early dementia, when sufficient skills are retained and progression is slow, a licence may be issued subject to annual review.

A formal driving assessment may be necessary (see Appendix G, page 118).

⚠️ Must not drive and must notify the DVLA.

Licensing will be refused or revoked.
Learning disability

Definition of severe learning disability followed by the DVLA

Significantly below average general intellectual functioning, accompanied by severe limitations in adaptive functioning in at least two of these areas:

- communication
- self-care
- home-living
- social/interpersonal skills
- self-direction
- functional academic skills
- work
- leisure
- health and safety

Drug misuse or dependence ........................................... 80
Seizure associated with drug use ..................................... 82
Chapter 05: Drug or alcohol misuse and dependence

Alcohol misuse

Guide to definition of misuse

There is no single definition to embrace all the variables within alcohol misuse – but the DVLA offers the following:

“A state that causes, because of consumption of alcohol, disturbance of behaviour, related disease or other consequences likely to cause the patient, their family or society present or future harm and that may or may not be associated with dependence.”

The World Health Organization’s classification (ICD-10) code F10.1 is relevant.

<table>
<thead>
<tr>
<th>Persistent alcohol misuse</th>
<th></th>
</tr>
</thead>
<tbody>

</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- Must not drive and must notify the DVLA. Licence will be refused or revoked until after:
  - a minimum of 6 months of controlled drinking or abstinence, and
  - normalisation of blood parameters.
- The patient should be referred for advice from medical or other sources during the period of no driving.

- Must not drive and must notify the DVLA. Licence will be refused or revoked until after:
  - a minimum of 1 year of controlled drinking or abstinence, and
  - normalisation of blood parameters.
- The patient should be referred for advice from medical or other sources during the period of no driving.

Alcohol dependence

Guide to definition of dependence

There is no single definition to embrace all the variables within alcohol dependence – but the DVLA offers the following:

“A cluster of behavioural, cognitive and physiological phenomena that develop after repeated alcohol use, including:

- a strong desire to take alcohol
- difficulties in controlling its use
- persistent use in spite of harmful consequences
- and with evidence of increased tolerance and sometimes a physical withdrawal state.”

Indicators may include any history of withdrawal symptoms, tolerance, detoxification or alcohol-related seizures.

The World Health Organization’s classification (ICD-10) code F10.2 is relevant.
Chapter 05: Drug or alcohol misuse and dependence

Alcohol-related disorders

<table>
<thead>
<tr>

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- Must not drive and must notify the DVLA.
- Licence will be refused or revoked until after a minimum of 1 year free of alcohol problems.
- Abstinence is usually required, with normalised blood parameters if relevant.

For both driving groups:
- licensing will require satisfactory medical reports from a doctor
- the DVLA may need to arrange independent medical examination and blood tests
- referral to and the support of a consultant specialist may be necessary.

**Examples**
- hepatic cirrhosis with neuropsychiatric impairment
- alcohol induced psychosis

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- Must not drive and must notify the DVLA.
- Licence will be refused or revoked until:
  - recovery is satisfactory
  - any other relevant medical standards for fitness to drive are satisfied (for example, Chapter 4, psychiatric disorders, page 67).

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- Must not drive and must notify the DVLA.
- Licence will be refused or revoked permanently.

**Alcohol-related seizure**

Seizures associated with alcohol use are not considered provoked in terms of licensing.

If there is more than one seizure, the regulations governing epilepsy will apply to drivers in both groups (see Appendix B, page 103).
Group 1  
car and motorcycle  

- Must not drive and must notify the DVLA.
- Licence will be refused or revoked for a minimum of 6 months after the seizure.
- Subsequent licensing requires satisfaction of the fitness standards elsewhere in this chapter whenever there is a background of alcohol misuse and/or dependence to the seizure, and will include requirements for:
  - an appropriate period free from persistent alcohol misuse and/or dependence
  - independent medical assessment.
- Blood analysis and consultant specialist reports usually necessary.

Group 2  
bus and lorry  

- Must not drive and must notify the DVLA.
- Licence will be refused or revoked for a minimum of 5 years after the seizure.
- Subsequent licensing requires:
  - no underlying cerebral structural abnormality
  - no epilepsy medication for at least 5 years
  - maintained abstinence from alcohol if previously dependent
  - review by a specialist in addiction and a specialist in neurology.

### High-risk offenders

Defined in terms of the alcohol-related driving convictions below, the courts notify the DVLA of high-risk offenders.

An independent medical examination will be arranged when an application for licence reinstatement is received by the DVLA. The assessment includes:

- questionnaire
- serum CDT assay
- any further testing indicated.

If a licence is awarded, the 'till 70 licence is restored for Group 1 car and motorcycle driving. Consideration may be given to a Group 2 licence.

If a high risk offender has a previous history of alcohol dependence or persistent misuse but has satisfactory examination and blood tests, a short period licence is issued for ordinary and vocational entitlement but is dependent on their ability to meet the standards as specified.

A high-risk offender found to have a current history of alcohol misuse or dependence and/or unexplained abnormal blood test results will have the application refused.

### Definition

The high-risk offender scheme applies to drivers convicted of the following:

- one disqualification for driving or being in charge of a vehicle when the level of alcohol in the body equalled or exceeded either one of these measures:
  - 87.5 mcg per 100 mL of breath
  - 200.0 mg per 100 mL of blood
  - 267.5 mg per 100 mL of urine

continued
Drug misuse or dependence

The relevant classification codes for drug misuse or dependence are World Health Organization F11 to F19 inclusive (ICD-10).

The below requirements apply to cases of single-substance misuse or dependence, whereas multiple problems – including with alcohol misuse or dependence – are not compatible with fitness to drive or licensing consideration, in both groups of driver.

<table>
<thead>
<tr>
<th>Drug group</th>
<th>Group 1 car and motorcycle</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note on methadone**

Full compliance with an oral methadone maintenance programme supervised by a consultant specialist may allow licensing subject to favourable assessment and, usually, annual medical review. Similar criteria may apply for an oral buprenorphine programme. There should be no evidence of continued use of other substances, including cannabis.

</table>

### Benzodiazepines

Note on therapy versus misuse below.

### Note on benzodiazepines
The non-prescribed use of these agents and/or the use of a supratherapeutic dosage outside BNF guidelines constitutes misuse or dependence for licensing purposes – whether in a programme of substance withdrawal or maintenance, or otherwise.

The prescribed use of these drugs at the therapeutic doses listed in the BNF, without evidence of impairment, does not amount to misuse or dependence for licensing purposes (albeit, clinical dependence may exist).
# Seizure associated with drug use

Seizures associated with drug use are not considered provoked in terms of licensing. If there is more than one seizure, the regulations governing epilepsy will apply to drivers in both groups (see Appendix B, page 103).

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

**Solitary seizure**

- Must not drive and must notify the DVLA. Licence will be refused or revoked for a minimum of 6 months after the seizure. Subsequent licensing requires satisfaction of the fitness standards elsewhere in this chapter whenever there is a background of substance misuse or dependence to the seizure, and will include requirements for:
  - an appropriate period free from persistent alcohol misuse and/or dependence
  - independent medical assessment
  - usually, urine analysis and consultant specialist reports.

- Must not drive and must notify the DVLA. Licence will be refused or revoked for a minimum of 5 years after the seizure. Subsequent licensing requires:
  - no underlying cerebral structural abnormality
  - no epilepsy medication for at least 5 years
  - maintained abstinence from alcohol if previously dependent
  - review by a specialist in addiction and a specialist in neurology.

Relicensed drivers with former drug misuse or dependence should be advised as part of their after-care that recurrence would mean they must stop driving and must notify the DVLA.
06 Visual disorders

Minimum eyesight standards ................................................................. 84
Higher standard of visual acuity for bus and lorry drivers ................. 84
Minimum standards for field of vision ............................................... 85
Higher standards of field of vision for bus and lorry drivers ............ 86
Cataract ........................................................................................................ 87
Monocular vision ......................................................................................... 88

Diplopia ......................................................................................................... 89
Night blindness ......................................................................................... 90
Colour blindness ....................................................................................... 90
Blepharospasm ......................................................................................... 90
Minimum eyesight standards  
– all drivers

The law requires that all licensed drivers meet the following eyesight requirements (including drivers aided by prescribed glasses or contact lenses):

- in good daylight, able to read the registration mark fixed to a vehicle registered under current standards
  - at a distance of 20 metres with letters and numbers 79 mm high by 50 mm wide on a car registered since 1 September 2001
  - or
  - at a distance of 20.5 metres with letters and numbers 79 mm high by 57 mm wide on a car registered before 1 September 2001

- the visual acuity must be at least Snellen 6/12 with both eyes open or in the only eye if monocular.

Any driver unable to meet these standards must not drive and must notify the DVLA, which will refuse or revoke a licence.

The law also requires all drivers to have a minimum field of vision, as set out below.

Social care registration for a sight impairment or severe sight impairment is not compatible with DVLA driver licensing; such registration is notifiable.

Bioptic telescope devices are not accepted by the DVLA for driving.

Higher standard of visual acuity  
– bus and lorry drivers

Group 2 bus and lorry drivers require a higher standard of visual acuity in addition:

- a visual acuity (using corrective contact lenses where needed) of at least:
  - Snellen 6/7.5 (Snellen decimal 0.8) in the better eye
  - and
  - Snellen 6/60 (Snellen decimal 0.1) in the poorer eye

- if glasses are worn to meet the minimum standards, they should have a corrective power not exceeding +8 dioptres in any meridian of either lens.
Minimum standards for field of vision
– all drivers

The minimum field of vision for Group 1 driving is defined in the legislation:

A field of at least 120° on the horizontal measured using a target equivalent to the white Goldmann III4e settings.
The extension should be at least 50° left and right. In addition, there should be no significant defect in the binocular field that encroaches within 20° of the fixation above or below the horizontal meridian.

This means that homonymous or bitemporal defects that come close to fixation, whether hemianopic or quadrantanopic, are not usually acceptable for driving.

If the DVLA needs a visual field assessment for determining fitness to drive, it:
- requires the method to be a binocular Esterman field test
- may request monocular full field charts in specific conditions
- exceptionally, may consider a Goldmann perimetry assessment carried out to strict criteria.

The Secretary of State’s Honorary Medical Advisory Panel for Visual Disorders and Driving advises that, for an Esterman binocular chart to be considered reliable for licensing, the false-positive score must be no more than 20%. When assessing monocular charts and Goldmann perimetry, fixation accuracy will also be considered.

Defect affecting central area only (Esterman within 20 degree radius of fixation)

Only for the purposes of licensing Group 1 car and motorcycle driving:
- the following are generally regarded as acceptable central loss
  - scattered single missed points
  - a single cluster of up to 3 adjoining points.
- the following are generally regarded as unacceptable (‘significant’) central loss:
  - a cluster of 4 or more adjoining points that is either wholly or partly within the central 20° area
  - loss consisting of both a single cluster of 3 adjoining missed points up to and including 20° from fixation, and any additional separate missed points within the central 20° area
  - any central loss that is an extension of hemianopia or quadrantanopia of size greater than 3 missed points.

Defect affecting the peripheral areas – width assessment

Only for the purposes of licensing Group 1 car and motorcycle driving:
- the following will be disregarded when assessing the width of field
  - a cluster of up to 3 adjoining missed points, unattached to any other area of defect, lying on or across the horizontal meridian
  - a vertical defect of only single-point width but of any length, unattached to any other area of defect, which touches or cuts through the horizontal meridian.

continued
Exceptional cases

Group 1 drivers whose previous full driving entitlement was removed because of a field defect failing to satisfy the standard may be eligible for individual relicensing consideration as exceptional cases under the following strict criteria:

- defect must have been
  - present for at least 12 months
  - caused by an isolated event or a non-progressive condition
- there must be no other condition or pathology regarded as progressive and likely to be affecting the visual fields (panel’s advice is that certain medical conditions, for example glaucoma and retinitis pigmentosa, would always be considered as progressive and so could not be considered as exceptional cases)
- sight in both eyes
- no uncontrolled diplopia
- no other impairment of visual function, including
  - no glare sensitivity, contrast sensitivity or impairment of twilight vision
- clinical confirmation of full functional adaptation.

For exceptional cases considered to be potentially licensable under these criteria, the DVLA will then require a satisfactory practical driving assessment at an approved centre (see Appendix G, page 118).

Static visual field defect

For prospective learner drivers with a static visual field defect, a process is now in place to apply for a provisional licence. Details are on the DVLA website: www.gov.uk/government/publications/static-visual-field-defects-new-process

Monocular individuals cannot be considered as exceptional cases under the above criteria.

Higher standards of field of vision
– bus and lorry drivers

The minimum standard for the field of vision is defined by the legislation for Group 2 bus and lorry licensing as:

- a measurement of at least 160° on the horizontal plane
- extensions of at least 70° left and at least 70° right
- extensions of at least 30° above and at least 30° below the horizontal plane
- no significant defect within 70° left and 70° right between 30° up and 30° down (it would be acceptable to have a total of up to 3 missed points, which may or may not be contiguous*)
- no defect is present within a radius of the central 30°
- no other impairment of visual function, including no glare sensitivity, contrast sensitivity or impairment of twilight vision.

(*Points tested in the ‘letterbox’ outside the central radius of 30° from fixation.)

continued
Chapter 06: Visual disorders

For Group 2 bus and lorry driving, it would be acceptable for a defect on visual field charts to have an upper limit of a total of 3 missed points – which may be contiguous – within the letterbox but outside the central 30° radius.

A total of more than 3 missed points, however – even if not contiguous – would not be acceptable for Group 2 driving because of the higher standards required.

Note that no defects of any size within the letterbox are licensable if a contiguous defect outside it means the combination represents more than 3 missed points.

Note Exception 1 in ‘Exceptions allowed by older licences’ below.

Cataract

<td>Must not drive and must notify the DVLA. The law bars licensing if in one eye there is:</td>
</tr>
<tr>
<td>- must meet the same visual acuity and visual field standards as binocular drivers</td>
<td>- complete loss of vision or</td>
</tr>
<tr>
<td>- may drive only after clinical advice of successful adaptation to the condition.</td>
<td>- corrected acuity falls below Snellen 3/60 (Snellen decimal 0.05).</td>
</tr>
<tr>
<td>Only those monocular people who fail to meet these requirements are required to notify the DVLA.</td>
<td>All Group 2 drivers must at least match the minimum standards for Group 1 visual acuity. See also ‘grandfather rights’ below.</td>
</tr>
</tbody>
</table>

Exceptions for visual acuity allowed by older licences (‘grandfather rights’)

The standards for Group 1 car and motorcycle licensing must be met before any of the following exceptions can be afforded to Group 2 bus and lorry drivers holding older licences.

**Visual acuity**

*Exception 1*

A driver must have been awarded a Group 2 bus and lorry licence before 1 March 1992, and be able to complete a satisfactory certificate of experience, to be eligible. If the licence was awarded between 2 March 1992 and 31 December 1996, visual acuity with corrective lenses if needed must be at least 6/9 in the better eye and at least 6/12 in the other eye; uncorrected visual acuity may be worse than 3/60 in one eye only.

**Monocularity**

*Exception 2*

Must have been awarded a Group 2 bus and lorry licence before 1 January 1991, with the monocularity declared before this date.

*Exception 3*

Drivers with a pre-1997 Group 1 licence who are monocular may apply to renew their category C1 (vehicles 3.5t to 7.5t). They must be able to meet the minimum eyesight standards which apply to all drivers and also the higher standard of field of vision for Group 2 (bus and lorry) drivers.
## Visual field defects

⚠️ May drive and need not notify the DVLA unless there is cerebral metastasis (refer to malignant brain tumours, page 29 of Chapter 1, neurological disorders).

⚠️ Must not drive and must notify the DVLA.
Only those drivers with non-small cell lung cancer staged T1 N0 M0 may be considered individually for licensing.
Other lung tumours require no driving for 2 years following definitive treatment. Subsequent licensing requires:
- satisfactory treatment success
- no brain scan evidence of intracranial metastases (refer to malignant brain tumours, page 29 of Chapter 1, neurological disorders).

Excessive sleepiness
– including obstructive sleep apnoea syndrome

Excessive sleepiness having, or likely to have, an adverse effect on driving includes:
- obstructive sleep apnoea syndrome of any severity
- any other condition or medication that may cause excessive sleepiness.

Legislation states that objective sleep study measurements for driving assessment purposes should use the apnoea-hypopnea index (AHI). Recognising that not all sleep services use AHI, the DVLA will accept results of equivalent objective tests.

The ‘Tiredness can kill’ leaflet (INF159) is for drivers concerned about excessive sleepiness.

<table>

</tr>
</tbody>
</table>

In both driving groups, fitness to drive is affected by the risk of seizure (Chapter 1, neurological disorders, non-epileptic seizures, page 15).

All cases of eye cancer must meet the minimum requirements for vision (Chapter 6, page 83).

- Must be assessed but may not need to notify the DVLA. If there is a likelihood of cerebral metastasis and seizure, the DVLA must be notified. There must be no significant complication relevant to driving, such as:
  - specific limb impairment, for example due to bone tumour, primary or secondary
  - general impairment, for example due to advanced malignancy producing symptoms such as general weakness or cachexia that affects driving.
  The effects of any cancer treatment must also be considered – the generally debilitating effects of chemotherapy and radiotherapy in particular.

- Must be assessed and must notify the DVLA. Licensing requires specific consideration of the likelihood of cerebral metastasis and seizure, and there must be no complications, such as:
  - specific limb impairment, for example due to bone tumour, primary or secondary
  - general impairment, for example due to advanced malignancy producing symptoms such as general weakness or cachexia that affects driving.
  The effects of any cancer treatment must also be considered – the generally debilitating effects of chemotherapy and radiotherapy in particular.
Acquired immune deficiency syndrome (AIDS) and HIV infection

**HIV infection without AIDS**

If there is no AIDS-defining illness, individuals with HIV may drive and do not need to inform the DVLA of their status.

<table>
<thead>
<tr>

<td><img src="image" alt="May drive but must notify the DVLA. Licensing will be considered individually. Eligibility will require no symptoms likely to affect driving and the maintenance of a CD4 count of 200 cells/microlitre for at least 6 months." /></td>
</tr>
</tbody>
</table>

**Age-related fitness to drive**

**Older age is not necessarily a barrier to driving.**

- Functional ability, not chronological age is important in assessments.
- Multiple comorbidity should be recognised as becoming more likely with advancing age and considered when advising older drivers.
- Discontinuation of driving should be given consideration when an older person – or people around them – become aware of any combination of these potential age-related examples:
  - progressive loss of memory, impaired concentration and reaction time, or loss of confidence that may not be possible to regain.
- Physical frailty in itself would not necessarily restrict licensing, but assessment needs careful consideration of any potential impact on road safety.
- Age-related physical and mental changes vary greatly between individuals, though most will eventually affect driving.
- Professional judgement must determine what is acceptable decline and what is irreversible and/or a hazardous deterioration in health that may affect driving. Such decisions may require specialist opinion.

The DVLA has medical advisers ready to provide guidance to healthcare professionals. See contact details on page 12.
Chapter 08: Miscellaneous conditions

### Group 1
**car and motorcycle**

### Group 2
**bus and lorry**

#### Older age
- **Group 1**
  - When drivers reach the age of 70, they must confirm to the DVLA that they have no medical disability. Drivers over 70 receive a licence for 3 years after fitness to drive has been declared, to include satisfactory completion of medical questions in the application.

- **Group 2**
  - Bus and lorry drivers:
    - must make fresh licence applications every 5 years from the age of 45
    - annually from the age of 65.
  - Each application must be accompanied by medical confirmation of satisfactory fitness to drive.

#### Transplant
- **Group 1**
  - May drive and need not notify the DVLA.
  - Except: there must be no other, or underlying condition that requires any restriction or notification to the DVLA.

- **Group 2**
  - May drive and need not notify the DVLA.
  - Except: there must be no other, or underlying condition that requires any restriction. Failing this, the DVLA must be notified and may require individual assessment.

#### Devices or implants
- **Group 1**
  - May drive and need not notify the DVLA.
  - Except: there must be no other, or underlying condition that requires any restriction or notification to the DVLA.

- **Group 2**
  - May drive and need not notify the DVLA.
  - Except: there must be no other, or underlying condition that requires any restriction. Failing this, the DVLA must be notified and may require individual assessment.

Contents
Chapter 08: Miscellaneous conditions

Cognitive decline or impairment
– including early dementia and after stroke or head injury

There is no single simple marker for the assessment of impaired cognitive function relevant to driving, although the satisfactory ability to manage day-to-day living could provide a yardstick of cognitive competence.

In-car, on-the-road assessments (Appendix G, page 118) are an invaluable way of ensuring, in valid licence holders, there are no features liable to present a high risk to road safety, including these examples:

- visual inattention, notable distractibility, impaired multi-task performance.

The following are also important in showing there is no impairment likely to affect driving:

- adequate performance in reaction times, memory, concentration and confidence.

Cognitive disability

<table>

</tr>
</tbody>
</table>

Driving after surgery

Evaluating the likely effects of postoperative recovery

Notwithstanding any restrictions or requirements outlined in other chapters of this document, drivers do not need to notify the DVLA of surgical recovery unless it is likely to affect driving and persist for more than 3 months.

Licence holders wishing to drive after surgery should establish with their own doctors when it would be safe to do so.

Any decision regarding returning to driving must take into account several issues, including:

- recovery from the effects of the procedure
- anaesthetic recovery from the effects of the procedure
- any distracting effect of pain
- analgesia-related impairments (sedation or cognitive impairment)
- other restrictions caused by the surgery, the underlying condition or any comorbidities.

Drivers have the legal responsibility to remain in control of a vehicle at all times.

Drivers must ensure they remain covered by insurance to drive after surgery.
Temporary medical conditions

Drivers generally do not need to notify the DVLA of conditions for which clinical advice has indicated less than 3 months of no driving.

If the judgement of the treating clinician is that the DVLA needs to be notified, the healthcare professional should advise the patient to contact the DVLA.

Such a judgement may be necessary for any of a range of conditions that may temporarily affect driving, including, but not limited to:

- postoperative recovery (see ‘Driving after surgery’, page 99)
- severe migraine
- limb injuries expected to show normal recovery
- pregnancy associated with fainting or light-headedness
- hyperemesis gravidarum
- hypertension of pregnancy
- recovery following Caesarean section
- deep vein thrombosis or pulmonary embolism.

Fractures

A driver does not need to notify the DVLA of a fracture, but if recovery post-fracture is prolonged for more than 3 months, the treating clinician should offer advice on a safe time to resume driving.
Medication effects

It is an offence to drive or attempt to drive while unfit because of alcohol and/or drug use – and driving laws do not distinguish between illegal and prescribed drugs.

Drivers taking prescribed drugs subject to the drug-driving legislation will need to be advised to carry confirmation that these were prescribed by a registered medical practitioner.

Some prescription and over-the-counter medicines can affect driving skills through drowsiness, impaired judgement and other effects.

Prescribers and dispensers should consider any risk of medications, single or combined, in terms of driving – and advise patients accordingly.

Without providing an exhaustive list, the following drug groups require consideration:

- **benzodiazepines** – these may cause sufficient sedation to make driving unsafe
- **antidepressants** – sedating tricyclics have a greater propensity to impair driving than SSRIs, which are less sedating. Advice for individual driving safety should be considered carefully for all antidepressants
- **antipsychotics** – many of these drugs will have some degree of sedating side effect via action on central dopaminergic receptors. Older drugs (chlorpromazine, for example) are highly sedating due to effects on cholinergic and histamine receptors. Newer drugs (olanzapine or quetiapine, for example) may also be sedating; others less so (risperidone, ziprasidone or aripiprazole, for example)
- **opioids** – cognitive performance may be reduced with these, especially at the start of use, but neuro-adaptation is established in most cases. Driving impairment is possible because of the persistent miotic effects of these drugs on vision.

Also refer to Chapter 4, psychiatric disorders (page 67), and Chapter 5, drug or alcohol misuse and dependence (page 76).
Appendix A: The legal basis for the medical standards

The Secretary of State for Transport, acting through the DVLA, has the responsibility of ensuring all licence holders are fit to drive.

The legal basis of fitness to drive in the UK lies in the following legislation:

- European Commission’s Third Directive on driving licences (2006/126/EC) – which came into effect here on 19 January 2013
- Road Traffic Act 1988
- Motor Vehicles (Driving Licences) Regulations 1999 (as amended).

According to Section 92 of the Road Traffic Act 1988:

- A relevant disability is any condition which is either prescribed (by Regulations) or any other disability where driving is likely to be a source of danger to the public. A driver who is suffering from a relevant disability must not be licensed, but there are some prescribed disabilities where licensing is permitted provided certain conditions are met.
- Prospective disabilities are any medical conditions that, because of their progressive or intermittent nature, may develop into relevant disabilities in time. Examples are Parkinson’s disease and early dementia. A driver with a prospective disability may be granted a driving licence for up to 5 years, after which renewal requires further medical review.

Sections 92 and 94 of the Road Traffic Act 1988 also cover drivers with physical disabilities who require adaptations to their vehicles to ensure safe control. These adaptations must be coded and shown on the licence. See Appendix F, disabilities and vehicle adaptations (page 117) and Appendix G, Mobility Centres and Driving Assessment Centres (page 118).

‘Serious neurological disorders’

Changes to Annex III of the EC Directive 2006/126/EC require that driving licences shall not be issued to, nor renewed for, applicants with serious neurological disorders, unless supported by the applicant’s doctor.

A serious neurological disorder is defined for the purposes of driver licensing as any condition of the central or peripheral nervous system that has led, or may lead, to functional deficiency (sensory, including special senses, motor, and/or cognitive deficiency), and that could affect ability to drive.

When the DVLA evaluates the licensing of these applicants, it will consider the functional status and risk of progression. A short-term licence for renewal after medical review is generally issued whenever there is a risk of progression.

Further information relating to specific functional criteria is found in the following chapters:

- Chapter 1, neurological disorders (page 13)
- Chapter 4, psychiatric disorders (page 67)
- Chapter 6, visual disorders (page 83)
- Chapter 8, miscellaneous conditions – excessive sleepiness (page 95).
Appendix B
Epilepsy regulations and further guidance

The legislation governing drivers with epilepsy

The following two boxes extract the paragraphs of the Motor Vehicle (Driving Licences) Regulations 1999 (as amended) that govern the way in which epilepsy is ‘prescribed’ as a ‘relevant’ disability for Group 1 or Group 2 drivers (also see Appendix A, the legal basis for the medical standards, page 102).

Group 1 car and motorcycle

(2) Epilepsy is prescribed for the purposes of section 92(2) of the Traffic Act 1998 as a relevant disability in relation to an applicant for, or a holder of, a Group 1 licence who has had 2 or more epileptic seizures during the previous 5-year period.

(2A) Epilepsy is prescribed for the purposes of section 92(4) of the Traffic Act 1998 in relation to an applicant for a Group 1 licence who satisfies the conditions set out in paragraph (2F) below and who has either:

a) been free from any unprovoked seizure during the period of 1 year immediately preceding the date when the licence is granted

or

b) during that 1 year period has suffered no unprovoked seizure other than a permitted seizure.

(2B) A permitted seizure for the purposes of paragraph (2A) b) is a seizure – which can include a medication-adjustment seizure – falling within only one of the:

a) permitted patterns of seizure

or

b) a medication-adjustment seizure, where:

i. that medication-adjustment seizure does not fall within a permitted pattern of seizure

ii. previously effective medication has been reinstated for at least 6 months immediately preceding the date when the licence is granted

iii. that seizure occurred more than 6 months before the date when the licence is granted

and

iv. there have been no other unprovoked seizures since that seizure

or

i. that earlier seizure has, to that point, formed part of only one permitted pattern of seizure and has occurred prior to any medication-adjustment seizure not falling within the same permitted pattern

or

ii. it is a medication-adjustment seizure, which was not followed by any other type of unprovoked seizure, except for another medication-adjustment seizure.

continued
Appendix B: Epilepsy regulations and further guidance

(2C) A permitted pattern of seizure for the purposes of paragraph (2B) is a pattern of seizures:
   a) occurring during sleep, where:
      i. there has been a seizure while asleep more than 1 year before the date when the licence is granted
      ii. there have been seizures only while asleep between the date of that seizure while asleep and the date the licence is granted
         and
      iii. there has never been an unprovoked seizure while awake
         or
   b) occurring during sleep, where:
      i. there has been a seizure while asleep more than 3 years before the date when the licence is granted;
      ii. there have been seizures only while asleep between the date of that seizure while asleep and the date the licence is granted
         and
      iii. there is also a history of unprovoked seizure while awake, the last of which occurred more than 3 years before the date when the licence is granted
         or
   c) without influence on consciousness or the ability to act, where:
      i. such a seizure has occurred more than 1 year before the date when the licence is granted
      ii. here have only been such seizures between the date of that seizure and the date when the licence is granted
         and
      iii. there has never been any other type of unprovoked seizure.

(2D) An isolated seizure is prescribed for the purposes of section 92(2) of the Traffic Act 1998 as a relevant disability in relation to an applicant for, or a holder of, a Group 1 licence:
   a) in a case where there is an underlying causative factor that may increase future risk, where such a seizure has occurred during the previous 1 year period
      and
   b) in any other case, where such a seizure has occurred during the previous 6 month period.
Appendix B: Epilepsy regulations and further guidance

(2E) An isolated seizure is prescribed for the purposes of section 92(4) b) of the Traffic Act 1998 in relation to an applicant for a Group 1 licence:
   a) who:
      i. in a case where there is an underlying causative factor that may increase future risk, has had such a seizure more than 1 year immediately before the date when the licence is granted
      and
      ii. in any other case, has had such a seizure more than 6 months immediately before the date when the licence is granted
   b) who has had no other unprovoked seizure since that seizure
   and
   c) who satisfies the condition set out in paragraph (2F).

(2F) The conditions mentioned immediately above are that:
   a) so far as is predictable, the applicant complies with the directions regarding treatment for epilepsy or isolated seizure, including directions as to regular medical check-ups made as part of that treatment, which may from time to time be given by a registered medical practitioner or one of the clinical team working under the supervision of that registered medical practitioner
   b) if required to do so by the Secretary of State, the applicant has provided a signed declaration agreeing to observe the condition in sub-paragraph a) immediately above
   c) if required by the Secretary of State, there has been an appropriate medical assessment by a registered medical practitioner
   and
   d) the Secretary of State is satisfied that the driving of a vehicle by the applicant in accordance with the licence is not likely to be a source of danger to the public.

Group 2 bus and lorry

(8A) Epilepsy is prescribed for the purposes of section 92(4) b) of the Traffic Act 1998 in relation to an applicant for a group 2 licence who:
   a) in the case of a person whose last epileptic seizure was an isolated seizure satisfies the conditions in paragraph (8C) and (8D)
   or
   b) in any other case, satisfies the conditions set out in paragraph (8D) and who, for a period of at least 10 years immediately preceding the date when the licence is granted has:
      i. been free from any epileptic seizure
      and
      ii. has not been prescribed any medication to treat epilepsy.

continued
Appendix B: Epilepsy regulations and further guidance

(8B) An isolated seizure is prescribed for the purposes of section 92(2) of the Traffic Act 1998 as a relevant disability, in relation to an applicant for, or a holder of, a Group 2 licence, where during the previous 5 year period, such a seizure has occurred, or that person has been prescribed medication to treat epilepsy or a seizure.

(8C) An isolated seizure is prescribed for the purposes of section 92(4) b) of the Traffic Act 1998 in relation to an applicant for a Group 2 licence who satisfies the conditions set out in paragraph (8D) and who, for a period of at least 5 years immediately preceding the date when the licence is granted:

a) has been free from any unprovoked seizure

and

b) has not been prescribed medication to treat epilepsy or a seizure.

(8D) The conditions mentioned immediately above are that:

a) if required by the Secretary of State, there has been an appropriate medical assessment by a neurologist

and

b) the Secretary of State is satisfied that the driving of a vehicle by the applicant, in accordance with the licence, is not likely to be a source of danger to the public.

Withdrawal of epilepsy medication

This guidance relates only to epilepsy treatment.

During the therapeutic procedure of epilepsy medication being withdrawn by a medical practitioner, the risk of further epileptic seizures should be noted from a medicolegal point of view.

If an epileptic seizure does occur, the patient will need to satisfy driving licence regulations before resuming driving and will need to be counselled accordingly.

It is clearly recognised that withdrawal of epilepsy medication is associated with a risk of seizure recurrence. A number of studies have shown this, including a randomised study of withdrawal in patients in remission conducted by the Medical Research Council's study group on epilepsy drug withdrawal. This study showed a 40% increased risk of seizure associated with the first year of withdrawal compared with continued treatment.

The Secretary of State for Transport’s Honorary Medical Advisory Panel on Driving and Disorders of the Nervous System states that patients should be warned of the risk they run, both of losing their driving licence and of having a seizure that could result in a road traffic accident.

The Advisory Panel states that drivers should usually be advised not to drive from the start of the withdrawal period and for 6 months after treatment cessation – it considers that a person remains as much at risk of seizure during the withdrawal as during the following 6 months.
This advice may not be appropriate in every case, however. One specific example is withdrawal of anticonvulsant medication when there is a well-established history of seizures only while asleep.

In such cases, any restriction on driving is best determined by the physicians concerned, after considering the history. It is the patient’s legal duty to comply with medical advice on driving.

It is important to remember that the epilepsy regulations remain relevant in cases of medication being omitted as opposed to withdrawn, such as on admission to hospital.

For changes of medication, for example due to side effect profiles, the following general advice is applicable:

- When changing from one medication to another and both would be reasonably expected to be equally efficacious, then no period of time off driving is recommended.
- When the new medication is felt to be less efficacious than the previous medication, the 6 months off driving period is recommended. This time period would start from the end of the change over period.

Provoked seizures

For Group 1 car motorcycle, and possibly Group 2 bus and lorry categories, provoked or acute symptomatic seizures may be dealt with on an individual basis by the DVLA if there is no previous unprovoked seizure history.

Unprovoked seizures associated with alcohol or drug misuse, sleep deprivation or a structural abnormality are not considered provoked for licensing purposes. Similarly, reports of seizure as a side-effect of prescribed medication do not automatically imply that such events will be considered as provoked. These would normally, in the absence of a previous unprovoked seizure, require 6 months off driving for Group 1 driving and 5 years for Group 2 licensing. Multiple medication induced seizures would not normally be classified as epilepsy for the purposes of driver licensing.

For seizure with alcohol or illicit drugs, see Chapter 5, page 76.

Doctors may wish to advise patients that the likely total period of time they will be required by the DVLA not to drive will be influenced by, among other things:

- whether it is clear that the seizure has been provoked by a stimulus that does not convey any risk of recurrence and does not represent an unmasking of an underlying liability
  and
- whether the stimulus has been appropriately managed or is unlikely to occur at the wheel.

In the absence of any previous seizure history or previous cerebral pathology, the following seizures may also be treated as provoked:

- eclamptic seizures
- reflex anoxic seizures
- seizure in the first week following a head injury
- at the time of a stroke or TIA, or within the ensuing 24 hours
- during intracranial surgery or the ensuing 24 hours
- associated with severe electrolyte disturbance.
Appendix C: Cardiovascular considerations

Group 1 car and motorcycle and Group 2 bus and lorry entitlements

Medication
If drug treatment for any cardiovascular condition is required, any adverse effects likely to affect safe driving will necessitate the licence being refused or revoked.

Group 2 bus and lorry entitlement only

Licence duration
A bus or lorry licence issued after cardiac assessment – usually for ischaemic or untreated heart valve disease – will usually be short-term, for a maximum licence duration of 3 years, and licence renewal will require satisfactory medical reports.

Exercise tolerance testing
The DVLA no longer requires regular anti-anginal medication (i.e., nitrates, bete blockers, calcium channel blockers, nicorandil, ivabradine and ranolazine prescribed for anti-anginal purposes) to be stopped prior to exercise tolerance testing. When any of these drugs are prescribed purely for the control of hypertension or an arrhythmia, then discontinuation prior to exercise testing is not required. The requirements for exercise evaluation are:

1. The test must be on a bicycle (cycling for 10 minutes with 20 W per minute increments, to a total of 200 W) or treadmill.
2. The patient should be able to complete 3 stages of the standard Bruce protocol or equivalent safely, while remaining free of signs of cardiovascular dysfunction, viz:
   - angina pectoris
   - syncope
   - hypotension.
3. There must be no sustained ventricular tachycardia and/or electrocardiographic ST segment shift (usually of not more than 2 mm horizontal or down-sloping) that is interpreted by a cardiologist as indicative of myocardial ischaemia, either during exercise or the recovery period.

Should atrial fibrillation develop de novo during exercise testing, the licensing requirements will be the same as for individuals with pre-existing atrial fibrillation – that is, provided all the DVLA exercise tolerance test criteria above are met, licensing will be subject to echocardiogram and confirmation of left ventricular ejection fraction of at least 40%.

The DVLA will require exercise evaluation at regular intervals not to exceed 3 years if there is established coronary heart disease.
Appendix C: Cardiovascular considerations

Chest pain of uncertain cause (angina not yet excluded)
Exercise testing should be performed as outlined above.
Individuals with a locomotor or other disability who cannot undergo or comply with the exercise test requirements will require a gated myocardial perfusion scan or stress echo study accompanied when required by specialist cardiological opinion.

Stress myocardial perfusion scan or stress echocardiography
When the DVLA requires these imaging tests, the relevant licensing standards are as follows, provided the LV ejection fraction is 40% or more:
- no more than 10% of the myocardium is affected by reversible ischaemic change on myocardial perfusion imaging
  or
- no more than one segment is affected by reversible ischaemic change on stress echocardiography.

Full DVLA protocol requirements for these tests are available on request (see contact details on page 12).

Coronary angiography
For licensing purposes, the DVLA considers functional implication to be more predictive than anatomical findings in coronary artery disease. ‘Predictive’ refers to the risk of an infarct within 1 year. Grafts are considered as ‘coronary arteries’.

For this reason, exercise tolerance testing and, where necessary, myocardial perfusion imaging or stress echocardiography are the investigations of relevance (outlined above) with the standards as indicated to be applied.

Angiography is therefore not commissioned by the DVLA.
If there is a conflict between the results of the functional test and a recent angiography, the case will be considered individually. Licensing will not normally be granted, however, unless the coronary arteries are unobstructed or the stenosis is not flow-limiting. The LV ejection fraction must also be at least 40%.

Hypertrophic cardiomyopathy and exercise tolerance testing
For the purpose of assessing hypertrophic cardiomyopathy, the DVLA would consider an exercise tolerance test (see above) falling short of 9 minutes acceptable provided:
- there is no obvious cardiac cause for stopping the test in under 9 minutes
- there is a rise of at least 25 mm Hg in systolic blood pressure during exercise testing
- all other requirements are met as outlined under hypertrophic cardiomyopathy (page 52).
Appendix C: Cardiovascular considerations

Marfan syndrome: aortic root replacement
The DVLA will refuse or revoke a licence if there has been:
■ emergency aortic root surgery
■ elective aortic root surgery associated with complications or high risk factors – for example, aortic root, valve and arch (including de-branching) surgery, external aortic support operation.

A bus or lorry licence for annual review may be issued in elective aortic root replacement surgery provided:
■ surgery is successful without complications
■ there is satisfactory regular specialist follow-up
■ no evidence of suture-line aneurysm postoperatively and on 2-yearly MRI or CT surveillance following valve-sparing surgery for root replacement plus valve replacement.

Severe aortic stenosis
‘Severe’ is defined (European Society of Cardiology guidelines) as:
■ aortic valve area – less than 1cm²
  or
  – less than 0.6 cm²/m² body surface area (BSA)
■ mean aortic pressure gradient – greater than 40 mmHg
■ maximum jet velocity – greater than 4 metres/second.
Appendix D

INF188/2 leaflet ‘Information for drivers with diabetes’ and DIABINF leaflet ‘A guide to insulin treated diabetes and driving’

Drivers do not need to tell us if their diabetes is treated by tablets, diet, or both and they are free of the complications listed over the page.

Some people with diabetes develop associated problems that may affect their driving.
Hypoglycaemia (low blood sugar)

Hypoglycaemia (also known as a hypo) is the medical term for a low blood glucose (sugar) level.

Severe hypoglycaemia means the assistance of another person is required. The risk of hypoglycaemia is the main danger to safe driving and can occur with diabetes treated with insulin or tablets or both. This may endanger your own life as well as that of other road users. Many of the accidents caused by hypoglycaemia are because drivers carry on driving even though they get warning symptoms of hypoglycaemia. If you get warning symptoms of hypoglycaemia while driving you must stop as soon as safely possible – do not ignore the warning symptoms.

Early symptoms of Hypoglycaemia include:
- Sweating, shakiness or trembling, feeling hungry, fast pulse or palpitations, anxiety, tingling lips.

If you don’t treat this it may result in more severe symptoms such as:
- Slurred speech, difficulty concentrating, confusion, disorderly or irrational behaviour, which may be mistaken for drunkeness.

If left untreated this may lead to unconsciousness.

What you need to tell us about

By law you must tell us if any of the following applies:
- You suffer more than one episode of severe hypoglycaemia within the last 12 months. You must also tell us if you or your medical team feel you are at high risk of developing severe hypoglycaemia. For Group 2 drivers (bus/lorry), one episode of severe hypoglycaemia must be reported immediately.
- You develop impaired awareness of hypoglycaemia. (Difficulty in recognising the warning symptoms of low blood sugar).
- You suffer severe hypoglycaemia while driving.
- You need treatment with insulin.
- You need laser treatment to both eyes or in the remaining eye if you have sight in one eye only.
- You have problems with vision in both eyes, or in the remaining eye if you have sight in one eye only.

By law, you must be able to read, with glasses or contact lenses if necessary, a car number plate in good daylight at 20 metres. In addition, the visual acuity (with the aid of glasses or contact lenses if worn) must be at least 6/12 (0.5 decimal) with both eyes open, or in the only eye if monocular.
You develop any problems with the circulation, or sensation in your legs or feet which makes it necessary for you to drive certain types of vehicles only, for example automatic vehicles, or vehicles with a hand operated accelerator or brake. This must be shown on your driving licence.

An existing medical condition gets worse or you develop any other condition that may affect your driving safely.

In the interests of road safety, you must be sure that you can safely control a vehicle at all times.

**How to tell us**

If your doctor, specialist or optician tells you to report your condition to us, you need to fill in a Medical Questionnaire about diabetes (DIAB1). You can download this from www.gov.uk/driving-medical-conditions

**Phone:** 0300 790 6806.

**Write to:**

The applicant or licence holder must notify DVLA unless stated otherwise in the text.

**DIABINF**

**A Guide to Insulin Treated Diabetes and Driving**

Drivers who have any form of diabetes treated with any insulin preparation must inform DVLA
(Caveat: See Temporary Insulin Treatment)

**HYPOGLYCAEMIA**

Hypoglycaemia (also known as a hypo) is the medical term for a low blood glucose (sugar) level.

**Severe hypoglycaemia** means the assistance of another person is required.

The risk of hypoglycaemia is the main danger to safe driving and this risk increases the longer you are on insulin treatment. This may endanger your own life as well as that of other road users. Many of the accidents caused by hypoglycaemia are because drivers carry on driving even though they get warning symptoms of hypoglycaemia. If you get warning symptoms of hypoglycaemia whilst driving, you must always stop as soon as safely possible – do not ignore the warning symptoms.

**EARLY SYMPTOMS OF HYPOGLYCAEMIA INCLUDE:**

- Sweating, shakiness or trembling, feeling hungry, fast pulse or palpitations, anxiety, tingling lips.
- If you don’t treat this it may result in more severe symptoms such as:
  - Slurred speech, difficulty concentrating, confusion, disorderly or irrational behaviour, which may be mistaken for drunkenness.

If left untreated this may lead to unconsciousness.

**DRIVERS WITH INSULIN TREATED DIABETES ARE ADVISED TO TAKE THE FOLLOWING PRECAUTIONS.**

- You should always carry your glucose meter and blood glucose strips with you. You should check your blood glucose no more than 2 hours before the start of the first journey and every two hours whilst you are driving. If driving multiple short journeys, you do not necessarily need to test before each additional journey as long as you test every 2 hours while driving. More frequent testing may be required if for any reason there is a greater risk of hypoglycaemia for example after physical activity or altered meal routine. The intention is to ensure that blood glucose is always above 5.0mmol/l while driving.
  - In each case if your blood glucose is 5.0mmol/l or less, take a snack. If it is less than 4.0mmol/l or you feel hypoglycaemic, do not drive.
  - If hypoglycaemia develops while driving, stop the vehicle as soon as possible.
  - You should switch off the engine, remove the keys from the ignition and move from the driver’s seat.
  - You should not start driving until 45 minutes after blood glucose has returned to normal (confirmed by measuring blood glucose). It takes up to 45 minutes for the brain to recover fully.
  - Always keep an emergency supply of fast-acting carbohydrate such as glucose tablets or sweets within easy reach in the vehicle.
  - You should carry personal identification to show that you have diabetes in case of injury in a road traffic accident.
  - Particular care should be taken during changes of insulin regimens, changes of lifestyle, exercise, travel and pregnancy.
  - You must take regular meals, snacks and rest periods on long journeys. Always avoid alcohol.

**EYESIGHT**

All drivers are required by law to read, in good daylight (with glasses or corrective lenses if necessary), a car number plate from a distance of 20 metres. In addition, the visual acuity (with the aid of glasses or contact lenses if worn) must be at least 6/12 (0.5 decimal) with both eyes open, or in the only eye if monocular.

**LIMB PROBLEMS**

Limb problems/amputations are unlikely to prevent driving. They may be overcome by driving certain types of vehicles e.g. automatics or one with hand controls.

**YOU MUST INFORM DVLA IF:**

- You suffer more than one episode of severe hypoglycaemia (needing the assistance of another person) within the last 12 months. For Group 2 drivers (bus/lorry) one episode of severe hypoglycaemia must be reported immediately. You must also tell us if you or your medical team feels you are at high risk of developing hypoglycaemia.
  - You develop impaired awareness of hypoglycaemia. (difficulty in recognising the warning symptoms of low blood sugar)
  - You suffer severe hypoglycaemia while driving.
  - An existing medical condition gets worse or you develop any other condition that may affect you driving safely.

Appendix E: Important notes concerning psychiatric disorders

All mental health symptoms must be considered

Any psychiatric condition that does not fit neatly into the classifications in Chapter 4 will need to be reported to the DVLA if it is causing or is considered likely to cause symptoms that would affect driving.

Such symptoms include, for example:
- any impairment of consciousness or awareness
- any increased liability to distraction
- or any other symptoms affecting the safe operation of the vehicle.

The patient should be advised to declare both the condition and the symptoms of concern. It is the relationship of symptoms to driving that is of importance.

The Third Driving Licence Directive 2006/126/EC requires member states to set minimum medical standards of fitness to drive and sets out the requirements for mental health in broad terms:
- the laws make a clear distinction between the standards for Group 1 car and motorcycle, and Group 2 bus and lorry licensing. The standards for the latter are more stringent because of the size of the vehicles and the greater amounts of time spent at the wheel by occupational drivers
- severe mental disorder is a prescribed disability for the purposes of section 92 of the Road Traffic Act 1988. Regulations define “severe mental disorder” as including mental illness, arrested or incomplete development of the mind, psychopathic disorder, and severe impairment of intelligence or social functioning
- the laws require that standards of fitness to drive must reflect, not only the need for an improvement in the mental state, but also a period of stability, such that the risk of relapse can be assessed should the patient fail to recognise any deterioration
- misuse of or dependence on alcohol or drugs are cases that require consideration of the standards in Chapter 5 (page 76) in addition to those for psychiatric disorders in Chapter 4.

Medications

Section 4 of the Road Traffic Act 1988 does not differentiate between illicit and prescribed drugs. Any person driving or attempting to drive on a public highway or other public place while unfit due to any drug is liable for prosecution.
- All drugs with an action on the central nervous system can impair alertness, concentration and driving performance.
- This is of particular relevance at the initiation of treatment, or soon after, and also when dosage is being increased. Anyone who is adversely affected must not drive.
Appendix E: Important notes concerning psychiatric disorders

- It should be taken into account when planning the treatment of a patient who is a professional driver that the older tricyclic antidepressants can have pronounced anticholinergic and antihistaminic effects, which may impair driving, whereas the more recently developed antidepressants may have fewer such effects.
- Antipsychotic drugs, including depot preparations, can cause motor or extrapyramidal effects as well as sedation or poor concentration. These effects, either alone or in combination, may be sufficient to impair driving, and careful clinical assessment is required.
- The epileptogenic potential of psychotropic medication should be given particular consideration in patients who are professional drivers.
- Benzodiazepines are the psychotropic medications most likely to impair driving performance – the long-acting compounds in particular – and alcohol will potentiate effects.
- Doctors have a duty of care to advise their patients of the potential dangers of adverse effects from medications and their interactions with other substances, especially alcohol.

Electroconvulsive therapy

The likely severity of the underlying condition requiring electroconvulsive therapy (ECT) means the driver should be advised that they must notify the DVLA.

Electroconvulsive therapy is usually employed in the context of an acute intervention for a severe depressive illness or, less commonly, as longer-term maintenance therapy.

In both courses, it is the severity of the underlying mental health condition that is of prime importance to the determination of whether driving may be permitted.

A seizure induced by ECT is regarded as provoked for the purposes of fitness to drive and is not a bar to licensing and driving – under both Group 1 car and motorcycle, and Group 2 bus and lorry.

The concerns for driving are:

- severity of the underlying illness requiring ECT treatment
- potential cognitive or memory disturbances associated with both the underlying depression and the ECT therapy.

Driving must stop during an acute course of treatment with ECT and is not permitted until the relevant medical standards and observation periods associated with underlying conditions have been met, as set out in Chapter 4 (page 67) and with respect to any other mental health symptoms or psychiatric conditions that do not fit neatly into classifications.

Again, this guidance must stress that the underlying condition and response to treatment are what determine licensing and driving.

Where ECT is used as maintenance treatment with a single treatment sometimes given weeks apart there may be minimal or no symptoms. This would not affect driving or licensing providing there is no relapse of the underlying condition.

Driving must stop for 48 hours following the administration of an anaesthetic agent.
Appendix F: Disabilities and vehicle adaptations

Appendix F
Disabilities and vehicle adaptations

Group 1 car and motorcycle
Driving often remains possible with certain adjustments for a disability, whether for a static and progressive disorder or a relapsing one. These vehicle modifications may be needed for:

- permanent limb and spinal disabilities – for example, amputation, hemiplegia, cerebral palsy, ankylosing spondylitis, or severe arthritis (especially with pain)
- chronic neurological disorders – for example, multiple sclerosis, Parkinson’s disease, motor neurone disease, or peripheral neuropathy

Vehicle adaptations range from simple automatic transmission for many disorders, to sophisticated modifications such as joysticks and infrared controls for people with severe disabilities.

The DVLA will need to know about a disability and whether any controls require modification, and will ask the patient to complete a simple questionnaire.

The driving licence is coded to reflect any vehicle modifications.

Assessment centres offer people advice about driving with a disability (these are listed in Appendix G).

Note that a person in receipt of the mobility component of Personal Independence Payment can hold a driving licence from 16 years of age. (A person can’t apply for PIP until their 16th birthday.)

Group 2 bus and lorry
Some disabilities, if mild and non-progressive, may be compatible with driving large vehicles. The DVLA needs to be notified and will require an individual assessment.

Mobility scooters and powered wheelchairs
Users of Class 2 or 3 mobility vehicles – which are limited on the road to 4 mph or 8 mph – are not required to hold a driving licence, and they do not need to meet the medical standards for driving motor vehicles. The DVLA recommends the following, however:

- individuals with a medical condition that may affect their ability to drive these mobility vehicles should consult their GP first
- users should be able to read a car number plate from a distance of 12.3 metres.

More details are at GOV.UK – see Mobility scooters and powered wheelchairs: the rules.

INDEX

A
Abscess (intracerebral)
Chapter 1 (neurological disorders)
Acoustic neuroma/schwannoma
Chapter 1 (neurological disorders)
Acuity
Chapter 6 (visual disorders)
Acute coronary syndromes
Chapter 2 (cardiovascular disorders)
Acute encephalitic illness & meningitis
Chapter 1 (neurological disorders)
Acute psychotic disorders of any type
Chapter 4 (psychiatric disorders)
Age (older drivers)
Chapter 8 (miscellaneous conditions)
AIDS and HIV infection
Chapter 8 (miscellaneous conditions)
Alcohol misuse/dependence
Chapter 5 (drugs or alcohol misuse or dependency)
Alcohol seizures/disorders
Chapter 5 (drugs or alcohol misuse or dependency)
Alzheimers disease
Chapter 4 (psychiatric disorders)
Amaurosis fugax
Chapter 1 (neurological disorders)
Ambulance drivers
General information
Aneurysm (aortic)
Chapter 2 (cardiovascular disorders)
Angina (stable or unstable)
Chapter 2 (cardiovascular disorders)
Angiography (coronary)
Chapter 2 (cardiovascular disorders)
Anxiety
Chapter 4 (psychiatric disorders)
Aortic dissection (chronic)
Chapter 2 (cardiovascular disorders)
Arachnoid cysts
Chapter 1 (neurological disorders)
Arrhythmia
Chapter 2 (cardiovascular disorders)
Arrhythmogenic right ventricular cardiomyopathy (ARVC)
Chapter 2 (cardiovascular disorders)
Arteriovenous malformation
Chapter 1 (neurological disorders)
Asperger’s syndrome
Chapter 4 (psychiatric disorders)
Asthma
Chapter 7 (renal and respiratory disorders)
Atrial defibrillator
Chapter 2 (cardiovascular disorders)
Attention deficit hyperactivity disorder (ADHD)
Chapter 4 (psychiatric disorders)
Autism
Chapter 4 (psychiatric disorders)
Autistic spectrum disorder
Chapter 4 (psychiatric disorders)
B
Behavious disorders
Chapter 4 (psychiatric disorders)
Benign infratentorial tumour
Chapter 1 (neurological disorders)
Benign supratentorial tumour
Chapter 1 (neurological disorders)
Biploar illness
Chapter 4 (psychiatric disorders)
Blepharospasm
Chapter 6 (visual disorders)
Brain tumours
Chapter 1 (neurological disorders)
C

CABG
Chapter 2 (cardiovascular disorders)

Cancer other
Chapter 8 (miscellaneous conditions)

CAPD (continuous ambulatory peritoneal dialysis)
Chapter 7 (renal and respiratory disorders)

Carcinoma of lung
Chapter 7 (renal and respiratory disorders)

Cardio resynchronisation therapy
Chapter 2 (cardiovascular disorders)

Cardiomyopathy (hypertrophic)
Chapter 2 (cardiovascular disorders)

Cardiomyopathy (dilated)
Chapter 2 (cardiovascular disorders)

Carotid artery stenosis
Chapter 1 (neurological disorders)

Cataract
Chapter 6 (visual disorders)

Catheter ablation
Chapter 2 (cardiovascular disorders)

Cavernous malformation
Chapter 1 (neurological disorders)

Chronic neurological disorders
Chapter 1 (neurological disorders)

Chronic renal failure
Chapter 7 (renal and respiratory disorders)

Chronic subdural
Chapter 1 (neurological disorders)

COPD (chronic obstructive pulmonary disease)
Chapter 7 (renal and respiratory disorders)

Colour blindness
Chapter 6 (visual disorders)

Colloid cysts
Chapter 1 (neurological disorders)

Congenital heart disease
Chapter 2 (cardiovascular disorders)

Coronary angiography
Chapter 2 (cardiovascular disorders)

Cough syncope
Chapter 1 (neurological disorders)

Craniotomy
Chapter 1 (neurological disorders)

D

Defibrillator – cardioverter
Chapter 2 (cardiovascular disorders)

Deafness
Chapter 8 (miscellaneous conditions)

Dementia
Chapter 4 (psychiatric disorders)

Depression
Chapter 4 (psychiatric disorders)

Developmental disorders
Chapter 4 (psychiatric disorders)

Diabetes
Chapter 3 (diabetes mellitus)

Diabetes leaflet (INF188/2)
Appendix D

Diplopia
Chapter 6 (visual disorders)

Disabled drivers
Appendix F (disabilities and vehicle adaptations)

Disabled driving assessment centres
Appendix G (Mobility Centres and Driving Assessment Centres)

Driving after surgery
General information

Drug misuse/dependency
Chapter 5 (drugs or alcohol misuse or dependency)

Dural AV fistula
Chapter 1 (neurological disorders)

DVLA contact details
General information

E

ECG abnormality
Chapter 2 (cardiovascular disorders)

Eclamptic seizures
Chapter 1 (neurological disorders)
Index

**Encephalitic illness**  
Chapter 1 (neurological disorders)

**Epilepsy**  
Chapter 1 (neurological disorders)

**Epilepsy regulations**  
Chapter 1 (neurological disorders)

**ETT & hypertrophic cardiomyopathy**  
Chapter 2 (cardiovascular disorders)

**Excessive sleepiness**  
Chapter 8 (miscellaneous conditions)

**Exercise testing**  
Chapter 2 (cardiovascular disorders)

**Extraventricular drain**  
Chapter 1 (neurological disorders)

**F**

**Field of vision requirements**  
Chapter 6 (visual disorders)

**G**

**Giddiness**  
Chapter 1 (neurological disorders)

**Glaucoma**  
Chapter 6 (visual disorders)

**Gliomas**  
Chapter 1 (neurological disorders)

**H**

**Haematoma – Intracerebral**  
Chapter 1 (neurological disorders)

**Healthcare vehicle drivers**  
General information

**Head injury – traumatic**  
Chapter 1 (neurological disorders)

**Heart failure**  
Chapter 2 (cardiovascular disorders)

**Heart/heart & lung transplant**  
Chapter 2 (cardiovascular disorders)

**Heart valve disease**  
Chapter 2 (cardiovascular disorders)

**Hemianopia**  
Chapter 6 (visual disorders)

**High risk offender scheme**  
Chapter 5 (drugs or alcohol misuse or dependency)

**HIV infection**  
Chapter 8 (miscellaneous conditions)

**Huntingtons disease**  
Chapter 1 (neurological disorders)  
Appendix F (disabled drivers and vehicle adaptations)

**Hydrocephalus**  
Chapter 1 (neurological disorders)

**Hypertension**  
Chapter 2 (cardiovascular disorders)

**Hypertrophic cardiomyopathy**  
Chapter 2 (cardiovascular disorders)

**Hypoglycaemia**  
Chapter 8 (miscellaneous conditions)

**Hypomania/mania**  
Chapter 4 (psychiatric disorders)

**I**

**ICD**  
Chapter 2 (cardiovascular disorders)

**Impairment due to medication**  
General information

**Impairment of cognitive function**  
Chapter 8 (miscellaneous conditions)

**Impairment secondary to multiple medical conditions**  
General information

**Implanted electrodes**  
Chapter 1 (neurological disorders)

**Infratentorial AVM’s**  
Chapter 1 (neurological disorders)

**Intracerebral abscess**  
Chapter 1 (neurological disorders)

**Intracranial pressure monitor**  
Chapter 1 (neurological disorders)

**Intraventricular shunt**  
Chapter 1 (neurological disorders)

**Isolated seizure**  
Chapter 1 (neurological disorders)
L

Learning disability
Chapter 4 (psychiatric disorders)

Left bundle branch block
Chapter 2 (cardiovascular disorders)

Left ventricular assist devices
Chapter 2 (cardiovascular disorders)

Loss of consciousness/loss of or altered awareness
Chapter 1 (neurological disorders)

M

Malignant tumours
Chapter 1 (neurological disorders)

Marfan’s syndrome
Chapter 2 (cardiovascular disorders)

Meningioma
Chapter 1 (neurological disorders)

Meningitis
Chapter 1 (neurological disorders)

Mild cognitive impairment (MCI)
Chapter 4 (psychiatric disorders)

Monocular vision
Chapter 6 (visual disorders)

Motor cortex stimulator
Chapter 1 (neurological disorders)

Motor neurone disease
Chapter 1 (neurological disorders) and Appendix F (disabled drivers and vehicle adaptations)

Multiple sclerosis
Chapter 1 (neurological disorders)

Muscle disorders
Chapter 1 (neurological disorders)

Myocardial infarction
Chapter 2 (cardiovascular disorders)

N

Neuroendoscopic procedures
Chapter 1 (neurological disorders)

Night blindness
Chapter 6 (visual disorders)

Non-epileptic seizure attacks
Chapter 1 (neurological disorders)

Obstructive sleep apnoea syndrome
Chapter 8 (miscellaneous conditions)

Organic brain syndrome
Chapter 4 (psychiatric disorders)

P

Pacemaker implant
Chapter 2 (cardiovascular disorders)

Parkinsons disease
Chapter 1 (neurological disorders)

Percutaneous coronary intervention
Chapter 2 (cardiovascular disorders)

Peripheral arterial disease
Chapter 2 (cardiovascular disorders)

Peripheral neuropathy
Chapter 3 (diabetes mellitus)

Personality disorder
Chapter 4 (psychiatric disorders)

Pituitary tumour
Chapter 1 (neurological disorders)

Police vehicle drivers
General information

Pre-excitation
Chapter 2 (cardiovascular disorders)

Primary/central hypersomias
Chapter 1 (neurological disorders)

Provoked seizures
Chapter 1 (neurological disorders)

Psychiatric notes
Chapter 4 (psychiatric disorders)

Psychosis
Chapter 4 (psychiatric disorders)
Index

R
Reflex vasovagal syncope
Chapter 1 (neurological disorders)
Renal disorders
Chapter 7 (renal and respiratory disorders)
Respiratory disorders
Chapter 7 (renal and respiratory disorders)

S
Schizophrenia
Chapter 4 (psychiatric disorders)
Seizures
Chapter 1 (neurological disorders)
Chapter 5 (drugs or alcohol misuse or dependency)
Spontaneous acute subdural haematoma
Chapter 1 (neurological disorders)
Strokes/TIA’s
Chapter 1 (neurological disorders)
Subarachnoid haemorrhage
Chapter 1 (neurological disorders)
Subdural empyema
Chapter 1 (neurological disorders)
Substance misuse
Chapter 1 (neurological disorders)
Chapter 5 (drugs or alcohol misuse or dependency)
Chapter 4 (psychiatric disorders)
Supratentorial AVM’s
Chapter 1 (neurological disorders)
Syncopal attacks
Chapter 2 (cardiovascular disorders) and
Chapter 7 (renal and respiratory disorders)

T
Taxi licensing
General information
TIA
Chapter 1 (neurological disorders)
Transient global amnesia
Chapter 1 (neurological disorders)
Transient arrhythmias
Chapter 2 (cardiovascular disorders)
Transphenoidal surgery
Chapter 1 (neurological disorders)
Traumatic brain injury
Chapter 1 (neurological disorders)

U
Unpaced congenital complete heart block
Chapter 2 (cardiovascular disorders)

V
Valve heart disease
Chapter 2 (cardiovascular disorders)
Ventricular cardiomyopathy
Chapter 2 (cardiovascular disorders)
Visual acuity
Chapter 6 (visual disorders)
Visual field defects
Chapter 6 (visual disorders)
Visual field requirements
Chapter 6 (visual disorders)
Withdrawal of epileptic medication
Chapter 1 (neurological disorders)
